I'm running 3.1c of STadel (soon to be 3.1d) and it has yet to fail me either. Every so often a little bug pops up, but they're usually the kinds of things that Joe User would never find, and I have yet to find one that is lethal. If anything, it's that there are so many little nifty things that the documentation can't keep up with them.

Also, please note that it is possible to pick up UUCP mail from STadel through a program that David (orc) has written called UUCALL, which is why you can get to him from the net.

If you need more information on STadel, please feel free to ask. If you are on GEnie, try CATagory 8, TOPic 13. It's all on STadel.

2. updating 520ST

Newsgroup: comp.sys.atari.st
Date: 1987-11-04 15:29:19 UTC
From: plp@houdi.UUCP
Message-ID: <1405@houdi.UUCP>
Source record: 256202

I have an early (summer '85) 520 ST (SN# A1 1020292) with a single-sided floppy drive and TOS on disk not in ROM. The only software I have (besides BASIC and LOGO) is 1st Word of about the same vintage (I'd like to update that too, but I didn't get it through a dealer).
SO,
Does it make sense for me to upgrade my system (which I intend to use mostly for word processing, UNIX terminal, and maybe a little (monochrome) drawing)?
How much will it cost to get TOS/GEM in ROMs and does anyone know of trustworthy dealers in the Monmouth Country NJ area?
I've seen a fair amount of anxiety about the future of Atari expressed in this group so I'm wondering whether it makes sense to put any more money into the system I have or chalk it up to experience and go buy a PC-clone.

```
Some of you might want to check into Colorburst 3000 as well as
Spectrum 512. I believe Version 0.5 is PD and available on GEnie.
Word has it that it will do over 3000 shades and allow over 800 (!!)
on the screen at a time.

4. MicroEmaxen and argument passing in shells

Newsgroup: comp.sys.atari.st
Date: 1987-11-04 16:04:00 UTC
From: RDROYA01@ULKYVX.BITNET
Message-ID: <8711041830.AA09315@jade.berkeley.edu>
Source record: 256204

With all the talk about microEmaxen and argument passing, I thought that I would add the following to the fire. I have a program called uEmail which is an ME derivative. In keeping with RMS's request that all the micro knockoffs not be called EMACS, the name is not uEmacs. It has a number of compatible functions with GNUEmacs, and is designed to run as a front end to a connected host running EMACS or as a stand alone editor. uEmail uses low-level i/o for everything. I even linked out all of the library subroutines for streams and appropriated the 8K _fds[] for dynamic memory use. It includes its own shell for running non-GEM programs and can be execed at startup before the DESKTOP claims 32K of the available memory. It's a big sucker (~120K) and uses a number of startup files to define envirs, the screen font, and default macros (assigned to specific keys ala Bridger Martin's Backgrounder, a CP/M program). This is not a commercial for the editor because it is no longer available through the net.

About arg passing, I appropriated trap 0 to pass pointer to a structure to any interested program loaded in the shell. The stucture contains a good deal of useful info about the editor's state and includes the command line and a pointer to the alias table. I figure an unused trap is safe game. I reste the trap on exit. Since the ENVIR structure contains uEmail BUFFER info, I can write programs to filter buffers to new files, count words and the like. I've written a standard i/o package called stuei.c which gives character and line equivalents to getc, ungetc, and gets. These read from buffers inside the editor. I've also included a function pointer to a command line reader which allows full command editing. This allows a shell program to use edited command lines without the problems associated with GEM level inchar/outchar. Anyway, here is the standard header file for stuei.c just to give you an idea.

```
/* header file for uemail CLI programs which need to use the environment
* table.
*/

#define MAXBUF 16 /* # of buffers in __bp[] */
#define NFILEN 128 /* # of bytes, file name */
#define NBUFN 128 /* # of bytes, buffer name */
#define NLINE 256 /* # of bytes, line */
#define NKBDM 256 /* # of strokes, keyboard macro */
#define NPAT 128 /* # of bytes, pattern */
#define HUGE 1000 /* Huge number */
```

```
#define CTRL 0x0100 /* Control flag, or'ed in */
#define META 0x0200 /* Meta flag, or'ed in */
#define CTLX 0x0400 /* ^X flag, or'ed in */

Message-ID: <105100024@datacube>
Source record: 256207

Four wires? You must be referring to the 520, whose mouse connects through the side of the case. On the 1040, the mouse plugs in underneath the keyboard, adding to the wire count. Cutting the case with a hacksaw (or any other kind of saw) seems rather irreversible. The keyboard does come out as a single unit though, and it wouldn't take much to mount it to a small piece of wood if you're in that much of a hurry and don't care about looks. For the wiring, how about building a small adaptor with a single row header and an RJ-11 style (modular) plug/socket arrangement. They are available in six and even eight conductor (if memory serves) type configurations. I doubt that there would be a problem with using ordinary coiled phone cord; that's what's running my VT-220 keyboard right now!

8. new user asking for help.....?

Newsgroup: comp.sys.atari.st
Date: 1987-11-04 21:08:03 UTC
From: ins_ajcn@jhunix.UUCP
Message-ID: <5417@jhunix.UUCP>
Source record: 256208

Hey folks! I'm very much new to all of this, which is why I decided
to post this in the hopes that someone out there would be able to help me.

Basically my story is this: I'm a freshman at Johns Hopkins University.
I'm coming to you via their computing facilities i.e.- JHUNIX. Using their
facilities (I was able to get a student account), I have been to read this
news network for the past month or so. A few things have me confused.

1. UUDECODE - I take it from my perusals of the network that UUDECODE is way
different from ARC - but how different? How would I get UUDECODE?
Also, when UUDECODE (or is it UUENCODE) encodes a piece of software, does it
save it as an ascii text? I ask this because I have ST-TALK for my ST with
which I can "capture" stuff from the screen(s). It then saves the 'stuff' as
ascii text in a file. If I capture a program from Comp.sources.atari.st this
way and then use UUDECODE on it will it work? ST-TALK has XMODEM transfer, but
JHUNIX uses KERMIT. So I'm stuck with a problem there.

2. UNITERM - I've seen this mentioned a few times. From what I see it seems to be pretty
good. Does it have KERMIT? How would I get it and where?

3. GULAM and MINIX - Are these UNIX type shells? Are they any good? Are
they multitasking? Are they still available and where?

4. Other PD programs have caught my eye like Prolog, printer spoolers, and
Spectrum. Can these programs be sent by mail? I.E. If one of you have these
programs could you send them to me? Can anyone suggest BBS's that I can
try? A friend suggested the ATARI BBS and gave me their phone number. Are
ther others I could try?

Please mail me any reponses.

I suppose my mailing address would be:

ins_ajcn@jhunix.UUCP

but I'm not sure (like I said I'm new at this). If I'm wrong, maybe you can us
the header to figure out my real address.

thanks in advance,

Julio C. Navas

> in December.

I was at Comdex and talked to Jack Lang, Tim King, and Jessica Lang at length about this box. What I found out was quite enlightening to say the least, let me say this first, "This is a really neat machine! ", then let me say this second, "It ain't cheap, when you configure it like it Workstation, it costs like a Workstation." So before I go on lets add some numbers to these statements :

At the show the Perihelion folks were saying $2K for the ABAQ (Ay-bak) and you had to have a Mega ST as well ($1.5K - $3K depending on which one you have) and a monitor that can display the images your interested in ($.5 - $3K, where 500 gets you a Multisync, and 3K gets you the multisync II plus which can display 1K X 800 pixels), plus you really need a hard drive so add another 1K to 1.5K depending on size (20 - 40Meg) So minimum we're talking $5K to get a low-res color system with a 20Meg hard drive, upto $8K for a 40meg High res systems (which is cheaper than either a Mac II or a Color Sun). When the 'real' machines become available the ST will be optional (and hopefully they will have redesigned the clunky case) but they were murmering $5K sans monitor or hard drive. So for those of you who want a Workstation for the cost of an Amiga or ST will have to wait a few more years for the technology steamroller to get a little be farther down the road.

As for the machine it was running some neat demos that primarily showed off it's color capabilities. Since they were 'canned' images being replayed aka ShowAnim or some other framebuffer animator it was not clear how fast the actual machines were. One was running GEM on a 19" 1K X 1K monochrome desktop, unfortunately most GEM applications couldn't really hack the huge screen. I would be interested to know if Atari will be supporting both GEM and Helios on the machines (all the really good questions hit you after you've left the booth. :-)) from the looks of it, it did not appear likely. The Perihelion people were quick to point out that the slaved Mega was only providing I/O services and non of its memory was being used by the ABAQ. So I assume if you wanted to run GEM you would either emulate the 68000 or use a version of TOS in ROM that passed all

video requests on to the ABAQ.

Other interesting tidbits; the video memory (1 meg of video rams) was separate from the ABAQ's program memory (shown with 4 meg). The internal slots will accept boards with additional Transputers or memory on them so you could continue to beef up this thing. And while some of the Demos were written in Occam (INMOS's transputer language) Perihelion was going to support C as the primary development language (what no BCPL?). It also had a custom blitter that apparently was really fast however only the demos were available so I couldn't really test drive them all that well. Overall it looks like an interesting box and is probably going to excite a lot of graphics folks. I don't see a whole lot of them making it into the mythical home market, or the ever lucrative business market. If Inmos has really conquered its manufacturing problems and Helios lives up to its advance billing this should be worth a look at least. And while there were boxes to play look at, at the show, I know that more than half the work will be in the software.

So things to watch for :
o How Atari 'positions' this product. Depending on when it gets out the door it will be competing with 386/486 boxes, Mac IIs, and Low end Suns.
o What happens to the various ST owners. (In my opinion they should split their product line like the Apple II/Macintosh computers are truely separate.)
o Messages from people who have machines to play with of their own (I am of course available for Beta Testing :-))

Sorry it dragged on so long, it was one of the more interesting aspects of an otherwise PC/386/Laser Printer dominated show.

(You are in a maze of twisty little C004's, all alike...)

A presentation was given by Atari and Perihelion at the Cafe Royal in
London on 22/9/87, over 100 software developers, hardware manufacturers and
press people attended and no restrictions were made on the information
presented at the meeting. I attended and this a quick summary of the notes
I took at the meeting.

First a benchmark reported by Inmos: Multivariate regression analysis

IBM PC 45 minutes
T800 18 seconds
T800 x 4 7 seconds

Inmos also had a T800 powered multiuser flight simulator that kept 4 people
at a time happy shooting each other down. 4 T800's per user plus a T4 graphics
card and a load of T2's handling the joysticks. All in an ITEM box together.
The graphics animation was VERY smooth, far better than a SUN3/260C+fpa+gpone
flight simulator I have played with.

Atari and Perihelion have got together so that Perihelion are designing the
hardware and the software for a high performance workstation to be
manufactured and sold by Atari.

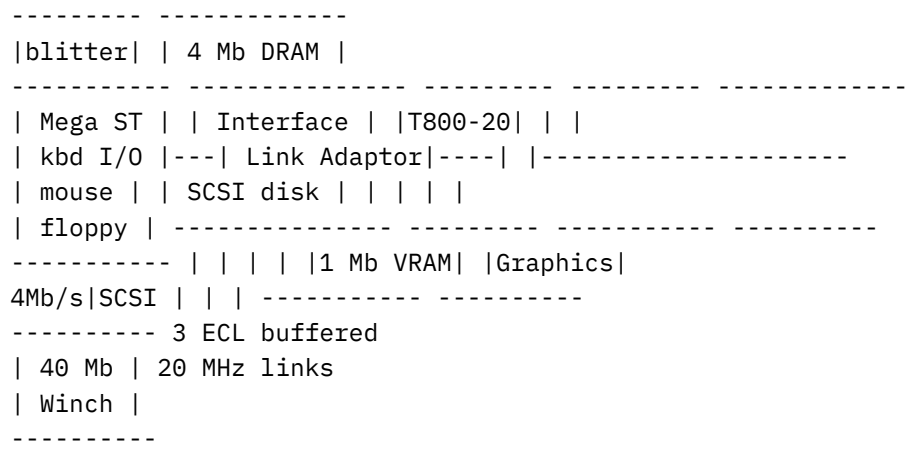
Perihelion Hardware

Perihelion is headed by Jack Lang in Cambridge, England. The hardware division
includes Richard Miller, Tim Dunn and ? Biscoe.

Stage 1 Hardware is a Mega ST add-on system intended for software developers.

Stage 2 Hardware is a compatible single box workstation.

The Mega ST is a front end I/O processor only. The block diagram looks like:



--------- -------------
|blitter| | 4 Mb DRAM |
---------- --------------- --------- --------- -------------
| Mega ST | | Interface | |T800-20| | |
| kbd I/O |---| Link Adaptor|----| |--------------------
| mouse | | SCSI disk | | | | |
| floppy | --------------- --------- ---------- ----------
---------- | | | | |1 Mb VRAM| |Graphics|
4Mb/s|SCSI | | | ---------- ----------
---------- 3 ECL buffered
| 40 Mb | 20 MHz links
| Winch |

The box takes up to 16 Mb on the motherboard (using 4Mbit DRAMS) and has three expansion slots which can take either 4Mb (1Mbit) or 16Mb (4Mbit) of DRAM each for a total in the box of 64 Mb. The expansion slots use a single DIN plug (VME-type) and the 3 ECL buffered links go onto them so that a slot can contain a board with more transputers on it. Size is enough for four T800s + 1 Mb each per card. Graphics cards can also be used to replace the built-in hardware.

The Blitter 2D fills at 128 Mpixels/sec, 2D block copy at 16 Mpixels/sec. (It has a novel architecture based on work by Phil Willis at Bath University).

Graphics modes:
1280 * 960 * 4 bpp
1024 * 768 * 8 bpp
640 * 480 * 8 bpp 2 screens for animation
512 * 480 * 32 bpp true colour + overlay and tag bits

60 Hz, not sure about interlace, has some genlock capability.

Probably uses Inmos G170 CLUT giving 256K colour shades.

SCSI disk uses true DMA synchronous SCSI interface to get 4Mbytes/s, 40Mb is minimum size.

A photo of a completed motherboard in box was shown, smaller than an IBM PC box with 3 fair sized slots.

Perihelion Software

This is based in Shepton Mallet, Somerset, England and is headed by Tim King ex of Metacomco, Amigados fame.

Operating system called Helios written in C to support single processor workstations, 4 processor workstations, 1000 processor farms or anything inbetween.

Helios is distributed, multiprocessor, multiuser, sympathetic to the Transputer and familiar to Unix users. Tim King has listened to the criticism of Amigados and has avoided a lot of the complaints about that system.

It is based on message passing with transparent passing across processors,
it uses a client/server model, has per-processor protection and capability
based access.

Networking and diskless workstations will be supported via the 3 ECL buffered
links with no extra hardware.

Applications can be written in 3 modes, the traditional single threaded program,
unix-like multiple processes
at a coarse grain level or parallel algorithms using a medium grain level.

Existing TOS/GEM applications can run on the Mega ST front end processor.

User Interface

X-11 window system standard.
GEM - translating GEM traps on the 68K i/o proc to the T800.
GEM running under X-11 may be provided.
Standard unix like shell command line interface.

Compatibility

MSDOS floppy disk format
UNIX(TM) hard disk format
UNIX(TM) compatible C library
UNIX(TM) command subset

Languages

C Pascal Lisp
Fortran BCPL Occam

Development Tools

Hosted on ST or Unix(TM) or MSDOS or native

Asm/link
C
Debugger

Atari's Position

They are looking for wider markets and want to go upmarket into workstation
technology. The hardware design will be Atari's property but Helios is already
spreading wider, another 4 companies are likely to use it so far.

It will be launched at COMDEX as a Mega ST add-on for developers.
Development systems available in Dec 87/Jan 88.
The standalone system will be launched at Hannover in March 88.
Product in the shops in June 88 in the UK.
Product in Europe 6 months later and US launch June 89, giving a years
head start to the UK software developers and a chance for the machine to
gather some applications software before it hits the US.

Cost

Priced well below Mac II, base level entry price (no winchester or monitor) aimed
at 1000 pounds according to Jack Lang.

For now they will provide a set of 3 manuals, User Manual, Developers Manual
and Technical Manual for 50 pounds, you then become a registered
developer and get a priority place in the queue for developers hardware
in December.

You don't know what you've been missing! It's (yet another) paint program with a difference: by using a background interrupt routine to reload the colour pallette once in a while, it will display 512 different colours on the screen at once (in low res). Now, there are limitations. It actually reloads the pallette 3 times per scan line, I think, giving 48 colours per line, with any 16 in each third of the line.

There was a slide show program using this technique on most BBS's and information services a while back. I've seen, but not used, the actual paint program.

I also tried the ZMDM stuff from "uh-info@uhupvm1" and was unable to
decode it using UUDECODE and ARC.
Who posted ZMDM?

Maybe, before it is posted again, (please), it could be tested
by someone else.

> work.

A few others and myself have also tried to uudecode that file from
uh-info@uhupvm1 unsuccessfully. I think the copy there is corrupted;
hence your uudecoder might be fine.

Font Disk #1 from SOftLogik has Devoll, Thames, and Spokane. All are
fairly nice. However, Devoll and Thames do NOT generate the 'less-than'
and 'greater-than' signs ('<', '>'). Typing Shift-, or Shift-. gives
you , and . respectively. Devoll also does not generate the = sign
correctly. Why, i do not know. Also the Columbia font (in PD) shows the
same syptoms. Has anyone tried the TIMES and HELVETICA font from
FONT FACTORY? Is it worth getting?

Latest (and greatest) version of GULAM is out. I believe Jim Turner
will be posting it any day now. (..hint, hint , Jim !!). The new version
has corrected the memory-mugging problem among other things. Many thanks
to Prabhaker and Jwahar again.

>Hi all, it's me again, I am just wondering one thing "Why are the binary and
>source news groups so dead?". There seems to be no activity at all on these
>news groups. Can anyone enlighten me as to the reason, I for one would
>like to see more of these great "Public Domain Programs" posted. I tried
>to post some stuff the other day, and it just disappeared.

I think it is time to relax rules for posting. A number of
people recently have written, expressing concern about the
lack of postings. This group used to be one of the most
active, and had *lots* of software.

Now, only occasional things get posted. The time that we introduced
a "moderator" for the two groups

comp.binaries.atari.st
comp.sources.atari.st

seems to be the time of the big slow-down in postings.

I propose that the "moderator" restriction be removed from these
two groups, and that people be allowed to post directly to them.

There can still be a role for a moderator. After a program
is posted, if the moderator wishes to post a note of endorsement
or condemnation, he/she may do so.

Those who choose to be conservative in trying out new
program may wait for the praise or censure and then may
follow this advise.

I am not happy with the current state of affairs.

From: ftw@datacube.UUCP
Message-ID: <105100025@datacube>
Source record: 256221

I would vote for method two. Since TOS can't multitask, it seems a little
dangerous to create a fork() function that doesn't quite work the way
one might "expect" it to. I'd rather have method number two, which
is like vfork()/exec().

> with the declaration:
> register char *p;

> Could someone tell me what's going on? I don't see anything wrong with
> the above bit of code...

What exactly do you want to do in line 603? It seems reasonable to assume you want to increment the pointer, which is what should happen given your code fragment. If this is the case, the extra indirection is not necessary. You can simply say:

```
while (*p != ' ' ...)
p++;
```

If you *really* want to increment the thing pointed at by "p", then you must say either:

```
while (*p != ' ' ...)
(*p)++; /* ugly */
```

or:

```
while (*p != ' ' ...)
++*p;
```

The reason being that "++" has higher precedence than indirection ("*"), so in your example the _pointer_ is incremented, then dereferenced by "*". The compiler is probably confused because it expects some form of assignment to be taking place at about that point, as in "ch = *p++;" which increments "p", and assigns the thing now pointed at by "p" to "ch". Your line 603 is in error (semantically), but so is the compiler if it can't deal with that expression. The compiler should produce a diagnostic like "foo.c: 603: useless expression".

The reason "++*p;" increments the thing pointed at by "p" is that "++" evaluates from right to left, and the expression on the right ("*p") is then evaluated.

24. FILE I/O

Newsgroup: comp.sys.atari.st
Date: 1987-11-05 19:57:56 UTC
From: jdn@homxc.UUCP
Message-ID: <2023@homxc.UUCP>
Source record: 256224

The functions Fseek, fseek (and Fread, fread, Fwrite, fwrite, etc.)
seem to perform essentially equivalent functions. To do simple file
i/o, I could use the capital F's or the small f's to do essentially
the same things. Is there a prefered choice? How do you choose?

My inclination is to use the small f's since I'll end up with code
which is easier to port to a unix environment. Is there something subtle
going on here that I'm missing?

Thanks,

There seems to be some talk on the net about the program Spectrum 512. Let me assure you that it is not public domain. This program is sold by Antic. I know because I have it, so if someone asks you for it remind them of two things:
1. It is not public domain.
2. If he pirites it, he is not just hurting the author of the prg. but all of us people that like to see new software hitting the market.

Think about it, look what happened to the 8-bit machine.

From: hakanson@mist.UUCP
Message-ID: <900@orstcs.CS.ORST.EDU>
Source record: 256227

By default, the last ten items on the popup menu are bound to the first ten phone numbers. The names of the numbers show up as menu items. So you just press the right mouse button to pop up the menu, and use the left mouse button to click on the item you want to dial.

One trick I use is to put some macros I want on the popup menu by defining them as shifted function keys, and then binding the menu items to the shifted function keys (I hardly ever use fn. keys in UniTerm, anyway). All this is done in the initialization file (UNITERM.MAC, I think). You can even rebind the ALT keys, if you want to.

As far as I know, 2.0beta was never "released", but I've been told (by Simon) that the real 2.0 should be ready this week. Only he knows what's changed since 2.0beta. No matter what, UniTerm is wonderful. Thanks, Simon.

I wonder too. In fact, I sent some stuff to turner@daisy earlier this week;
IF I don't either 1) see it go out, OR 2) get mail from Mr. Turner that it
was received and is pending (or that he doesn't think it suitable - that's
OK by me, I'm not an egomaniac about my code) OR 3) see something from Mr.
Turner in this group, THEN I'm gonna post it myself & d*mn the torpedoes.

Does this sentiment strike a chord out there?

30. TDI Modula-2 'commercial' version

Newsgroup: comp.sys.atari.st
Date: 1987-11-05 23:00:25 UTC
From: rling@uw-june.UUCP
Message-ID: <3549@uw-june.UUCP>
Source record: 256230

If you own TDI's Modula-2 commercial version (v3.01, the newest)
you might want to check your source files to see if they are corrupted.
The list of files that are corrupted are:

LINEA.MOD XBIOS.MOD FILESYST.MOD VDI*.MOD

GEMERROR.MOD (missing)

There are other problems. If your's is also corrupted I would
appreciate it if you would let TDI (Mike) and me know. The files
are corrupted on both sets of disks that they sent me. I went as
far as talking Mike through bringing up the files on their master
disk and looking at them, they were corrupted too.
Mike isn't one of the technical staff (they're in limbo) so
his comment was "I know what you're saying but if there's something
wrong why hasn't ANYBODY else said anything". So, for my own peace
of mind PLEASE let me know if the copy you have is bad or not.

Allow me to respond to my not totally correct response BEFORE I get flamed too much ;-)

For the record: In the original example, the expression: *p++ returns *p BEFORE the pointer is incremented, not after as I incorrectly stated at first. In my explanation: ch = *p++; then gets the value *p BEFORE p is incremented.

I still stand by my remarks about the solutions to the original problem. Just want to set the record straight; the fingers were in motion this morning before the brain was fully engaged. Hadn't finished that first cup of coffee!

My apologies...

From: katzung@laidbak.UUCP
Message-ID: <1226@laidbak.UUCP>
Source record: 256234

Keywords:

A colleague and I have done *EXSTENSIVE* hacking on UW. It now has a configuration file, file capture, optional title bar and sliders, programmable function keys, built in rs232 configuration, choice of emulation sizes (sorry, still only adm31), access to 6 fonts, printer support (text only), and a text clipboard mechanism.

Jump scrolling and some loop unwinding have improved the effective speed quite a bit.

Several people at Lachman are using it, but we have been on a feature binge for a long time and should freeze for a while before shipping it out (it shouldn't be too much longer now (kind of echoes when you say that, doesn't it :-))). I also want to say early on that we won't have time to do lots of integration, so if anyone has bright ideas of doing lots of additional hacking, please check with us first if you want us to integrate your changes.

If it works at all on a color system, I suspect it is not much fun to use (I haven't tried it).

Message-ID: <802@sbcs.sunysb.edu>
Source record: 256235

What follows is my summary of what Neil uploaded to GEnie.

Atari unveiled the Abaq, an ultra-high-performance workstation with blazing speed and dazzling graphics. It outruns a 68020 with math processor and about 10 times the speed of PC/AT technology. Configured to attach to the MegaST through DMA port and also as a stand-alone.
Also announced was a new CD player capable of reading CD-ROM disks and of playing musical CD disks. The CD-ROM is supported by a Mega and ST-compatible DMA interface, and will retail in early 1988 for under $600. A LAN was also announced - supposed compatible with the NETBIOS standard used by IBM and Novell. Communicates data at 1 megabit-per-sec.
The Atari laser printer was also shown.
Software-wise, Word Perfect, Microsoft Write were running at the show.
Others include IDRIS, professional CAD program, desktop publishing, etc.
Besides PC1, Atari also announced PC2 and PC4 (AT compatible)

36. IBM-PC floppy disk format

Newsgroup: comp.sys.atari.st
Date: 1987-11-06 09:48:02 UTC
From: WALDI@DHDIHEP1.BITNET
Message-ID: <8711060947.AA19132@ucbvax.Berkeley.EDU>
Source record: 256236

Date: 6 November 1987, 10:38:51 SET
From: Roland Waldi phone (6221) 564334 WALDI at DHDIHEP1
Inst. fuer Hochenergiephysik
D-6900 Heidelberg
To: INFO-ATA at SCORE.ST

I tried the "200% MS-DOS compatible" disk formatter recently posted
to this group: It fails to create disks readable by my IBM PC
(the same as DCFORMAT 2.2)! However, disks formatted on the PC
still can be read/written on the Atari without any problems, even
new folders can be created on the ST and read on the PC!
Also, if I copy those disks with a special copy program (designed
for backup of copy-protected disks), the copies made (formatted)
on the Atari work fine. So I decided to investigate further, and
actually found the difference, which makes normal Atari-formatted
disks fail on the PC: The IBM-PC's 3 1/2" drive needs a larger Gap
before the first sector of the disk (usual error message: "sector
not found"). The Atari formatting programs have about 70 bytes before
the first sector header, my IBM disks have more than twice that much!
Obviously, the Atari gap is too small for the IBM controller, which can
only read sectors 2...9 of a track. Since this may vary between
different drives due to hardware tolerances, many people may be
quite happy with DCFORMAT or IBMFMT -- others (like me) cannot
use it.

From: ftw@datacube.UUCP
Message-ID: <105100028@datacube>
Source record: 256237

Where to get the new ROMs:

If you are a registered developer...they are available from Atari.

How to install them:

On the 1040, which is what I have, you have to remove the top of the
case and power supply (which covers the area on the motherboard
where the ROMs live).

E-mail me for details on either or both of these issues. If I receive
a large number of requests, I can post to the net.

38. Re: External Keyboard

Newsgroup: comp.sys.atari.st
Date: 1987-11-06 14:55:04 UTC
From: dag@chinet.UUCP
Message-ID: <1823@chinet.UUCP>
Source record: 256238

Mr. Woods is mistaken -- The 520 does have the mouse/joystick ports on the side, but this adds wires to the keyboard connector, since it is the keyboard CPU that monitors these devices. The 520 has many more wires running between the keyboard and the main system board than the 1040. I don't remember the count on either board, but the 1040's (and newer 520) keyboard has the connectors mounted to the bottom, thus fewer wires. As to moving these keyboards out of the case, I've seen two successful attempts at the 1040. Neither involved cutting the case, though. A new keyboard case was constructed out of [cardboard|sheet metal] and a multi-conductor wire bundle was run between the old case and the new case.

As far as using phone cords for this purpose, most available will not safely handle the current required by the keyboard electronics. If you read the documentation that comes with a terminal/workstation equipped with the DEC LK201 keyboard, you will find warnings that you should not use ordinary phone cords with them. Fire may result. I've seen it happen, though only in an environmental chamber where that was the intended result. (I was with the PRO program at DEC while the keyboard was being designed.)

I hope this clears some things up.

39. IFF format

Newsgroup: comp.sys.atari.st
Date: 1987-11-06 15:53:57 UTC
From: 870646c@aucs.UUCP
Message-ID: <543@aucs.UUCP>
Source record: 256239

After doing some reseach of my own into the IFF, and the Degas Elite manual
I have found how we can exchange pics with the Amiba. Select the block copy
and put a frame around the whole picture, next select "save" from the block
menu, enter your picture name and hit return. This block is saved in IFF
format, to test it rename the file to *.IFF, where * is your pic name.
Select pic type from the file menu, select IFF, and read your pic in.
I hope this is of some use to some people.

41. Dead groups

Newsgroup: comp.sys.atari.st
Date: 1987-11-06 18:12:00 UTC
From: IHLS400@INDYCMS
Message-ID: <8711061915.AA28019@ucbvax.Berkeley.EDU>
Source record: 256241

>"Why are the binary and source news groups so dead?"

It seems they are dead because people insist on posting programs
to the Info mailing list instead.

** slow burn **

I don't know about the rest of you, but I'm a bit shy on disk space
here. It seems that many of the volumes of INFO-ATARI16 that are
coming across the net have UUEncoded programs included with them.
Most recently was a 690 line volume that included about 75 lines
of post and 615 lines of DC Format 2.21 for color AND we are told
that the monochrome version is next! I'm just as interested as
the next person in obtaining these programs, but PLEASE let me
do it in my own time from one of the file servers!! DON'T include
these in the message postings. The postings are distributed through
Bitnet as an entire volume. No one truly edits them. Please show
some consideration to those of us who cannot simply skip those
messages in which we have no interest currently as I assume you
can do in the newsgroups. If you've lost Mr. Turner's address
or whatever, post a message to that effect. I'm sure someone out
there has it handy, and posting that kind of message is MUCH shorter
than just posting 600 lines of program that I can't do anything with
right now.

Pretty please? With brown sugar and a cherry on top?

** cold water **

ssfln (small snack for line eater)

Today, whilst perusing books at my favourite computer bookstore
(Computer Book and Supply Centre Ltd. 1263 Bay Street, Toronto)
I saw with my very own eyes the mythical HD 3.5" disks, at only $99.95
for a box of 10, and the salesman kindly informed me that they were for
PS/2 (MOM! he said THAT word!), and require special hardware.
Gosh Batsman, the thought of 2Mbytes on a 3.5 makes me drool, so my question
is...

Does anybody out there in netland know anything about these little wonders,
aforementioned hardware, and most importantly, how I can make my ST
use these disks? is this a forlorn hope? am I doomed to insufficient
storage for the rest of time ? (please don't suggest I get a hard disk.
i am supposed to being doing real work right now, so I don't have time for
an extended flame on bizarre interfaces, outrageous costs, and laughable
reliabilty. until write-and-read-as-many-times-as-you-bloody-well-want
optical disks come along (and they will! RSN), I'd prefer to stay as far
away as I can from those aggravation-crates)

44. Animation Software

Newsgroup: comp.sys.atari.st
Date: 1987-11-06 23:01:00 UTC
From: Friesen@HIS-PHOENIX-MULTICS.ARPA
Message-ID: <871106230154.384646@HIS-PHOENIX-MULTICS.ARPA>
Source record: 256244

Does anyone know of a good animation program? I am interested in doing some fancy animation and do not know what's available. What I want to do is to make "movies" with my computer. From what I have heard, there is a new version of CAD 3-D out that sounds like what I want. What I want is to be able to draw one picture, and by manipulating that one picture get a lot of shots without having to redraw it. CAD 3-D is supposed to allow you to chose if you want wire frame pictures or not which is nice. It has many other features that seem good, however, I haven't seen the animation. I would like to know whether the animation is smooth or not, and if the drawing tools it has are good or not.

Thanks in advance, Aric Friesen.

Many thanks to Chuck McManis for his informative posting about the
show. I thought I'd post Antic's online repors from Compuserve as well.

Permission to reprint or excerpt is granted only if the following line
appears at the top of the article:

ANTIC PUBLISHING INC., COPYRIGHT 1987. REPRINTED BY PERMISSION

ATARI MEANS BUSINESS
A REPORT FROM THE 1988 COMDEX
By Anita Malnig, START Editor

Las Vegas, November 2, 1987 --

Atari intends to give the likes of Sun Microsystems and Apollo
Computers a run for the money with Abaq (the root word for abacus), the new
transputer-based workstation that the company is showing here.
By using RISC (Reduced Instruction Set Computer) architecture, the
workstation will operate at 10 MIPS (million instructions per second). The
latest graphics hardware and the IMS T-800 -- the Inmos Company's 32-bit
microprocessor -- combine to form affordable, powerful personal
workstations. A single transputer can deliver over ten times the power of
an IBM PC AT. However, there's even greater strength in numbers. You can
connect two, 10, 100 or even MORE transputers to create a relatively
low-cost computer workstation with the power of a supercomputer. (Talk is
that the price will be in the $5000 range.) When attached to a transputer,
the ST or Mega acts as the input/output device for the system. Transputers
can be linked via a built-in high-speed serial port to form a
multiprocessor array or a local area network.
Helios, the Unix-like operating system, was developed by the
Perihelion Company in Great Britain, as was the transputer board itself.
The Helios operating system encourages the use of many small programs which
work together to create a final product.
Shiraz Shivji, Atari's vice president of research and development,
expects that the transputer will be used primarily in engineering and
science applications. Included with Abaq will be a very high resolution
monitor, capable of four graphics modes: 1280 X 960 in 16 colors or
monochrome; 1024 X 768 in 256 colors; 640 X 480 in 256 colors with two
screens; and 512 X 480 in 16 million colors plus overlay. No firm delivery
date is set, but late 1988 seems to be the most talked-about time frame.
From a first-hand view, the crisp, vibrant graphics (such as four separate
pictures running simultaneously) were drawing crushing crowds.
CD-ROM FOR ATARI
The exciting CD-ROM player introduced at Comdex can read up to 540
megabytes of data or play music. It connects to Atari's ST and Mega

computers through the DMA (direct memory access) channel, a communications port that transmits data at up to 10 million bits per second. At 540Mb, the player can store more data than 1,000 floppy disks or 200,000 printed pages.

Demonstrated at the show is an English and French visual dictionary from Facts on File. It is categorized by topics such as transportation and food: click on the transportation theme and choose from an array of topics such as ferrys, container ships, airport terminals and so on -- all items illustrated. Speech output identifies each image in French and English.

Grolier's Encyclopedia also runs on this CD-ROM, as do audio CDs. Atari has a task force at work now developing more products for this player, which will be available at computer specialty dealers and retail outlets in February, 1988, at a suggested retail price of $599.

DO ATARI DESKTOP PUBLISHING

G.O. Graphics, in conjunction with Atari, will bring to market a sophisticated desktop publishing program called Deskset. This works as a front end to the CompuGraphics typesetting equipment, offering the use of 1,800 fonts. This is not just a desktop publishing program for four-page newsletters and the like: it could design entire publications such as Antic and START. It will output to such laser printers as the striking Atari laser printer, also being demonstrated with Deskset. (Look for the next Comdex installment for additional desktop publishing programs for the ST.) Deskset, which works only on a Mega, will work within the GEM environment and offers all the standard features of the most sophisticated desktop publishing programs -- features such as character compensation, kerning, columns, boxes, rules and the ability to merge text and graphics. Look for this product mid- to late 1988.

AND. . . ATARI PCS

The Atari PC1, introduced earlier this year, can be used as a local area network workstation or as a standalone personal computer. It runs at a top speed of 8 Mhz, with a software switch to set the clock speed to 4.77 when needed. The PC1 works with any CGA, MDA, EGA or multi-frequency monitor. Maximum color screen resolution is 640 X 350. The PC1 has a 64-color palette, with a maximum of 16 on the screen at a time. It is expected to retail at $800.

New to the Atari PC family is the PC2, a dual-speed XT compatible with five slots and hard-disk support. The PC4 is an 80286 microprocessor-based IBM PC/AT compatible machine. It has clock speeds of either 8 or 12 Mhz, VGA-compatible video, four AT-style expansion slots, up to one megabyte of system RAM and is ready for an 80287 numeric coprocessor.

Additionally, Atari is announcing "Moses PromiseLAN," a local area network that can connect up to 17 PCs using off-the-shelf telephone wire. They will also be developing Moses PromiseLAN adaptors for its Mega and ST computers. Thus, the Mega and Atari laser printer will be able to share data with PCs and Apple Macintoshes.

COMING NEXT UPDATE. . .

Watch for more third-party desktop publishing programs from Soft Logik, Timeworks, Migraph. . . Multiuser, Multitasking programs with the Idris operating system. . . desktop video from Antic Software. . . products galore from MichTron, Spectrum Holobyte, Word Perfect, Abacus, ISD

Marketing, B.E.S.T. and lots more.

Permission to reprint or excerpt is granted only if the following line
appears at the top of the article:

ANTIC PUBLISHING INC., COPYRIGHT 1987 REPRINTED BY PERMISSION.

ST SOFTWARE SHINES AT COMDEX:
Multi-user, Multitasking on the Mega
By Anita Malnig, START Editor

Las Vegas, November 3 --

At the very crowded Atari press conference at the Desert Inn on Monday, November 1, Atari announced its entrance into the serious business market with an array of multi-user, multitasking products. The Atari booth itself was crowded with exciting products, interested spectators and busy software personnel. Here's a run-down of what we saw at the Atari booth.
MULTI-USER, MULTITASKING
Along with high-quality third-party developers, Atari will offer multiuser, multitasking and serious vertical applications on the Mega using a Unix-like operating system called Idris (developed by Whitesmiths Ltd.). The company, Computer Tools, was and still is instrumental in finding companies whose programs can be ported over from the Unix environment to Idris and porting those programs.
Jefferson Software is now releasing a version of their Modula-2 Development System for the Mega to run under Idris, offering a powerful language to complement the multi-user, multitasking operating system.
American Network's Cash Register Plus, the first of the multiuser, multitasking applications, is a point-of-sale program that lets you store and search up to 3,000 items. It supports a Star 8340 printer -- small to print out receipts -- and an actual cash drawer. It includes a customer and inventory database and backs up all information to disk. It can support four terminals with all cables attached to the Mega. This is expected to be on sale mid-January 1988 for about $700 for all the components.
During your inventory search, you may want to do some word processing. There are several word processors to choose from in this Idris environment. From the Tigera Corporation comes Word Era, a feature-rich, high-performance word processing package on single- and multiuser systems. It has a Wang-compatible interface and document conversion capabilities. Word Era has the features of leading word processing software and more, including a window environment, voice recognition and voice annotation. It can also set up menus in French, German, Italian and Spanish, and supports a four-user system. Available during the first quarter of 1988, the multiuser price begins at $895.
Another word processor is CrystalWriter Plus from Syntactics, providing a library of model documents for frequently used formats such as letters, memos and reports. An organization can define its own "style sheet" for documents. The program has "plain English" commands and can be useful for writers, editors, secretaries, managers and engineers.
Also ported from the Unix world is Lex, a combined word processor and

database, from Trajectory Software. Its indexed file structure lets you retrieve the 10,000th record as quickly as the first. You can design your own forms and screen layouts, create short and more extensive glossary items, and do list processing and mail merges. It also comes with a built-in calculator which you can use concurrently as you write or edit. Also available is Lexet, which lets you interface the word processor and database with laser printers.

Atari Corp. is handling the networking capabilities through an agreement with Network Research Corp. With FUSION, Network Software will give the Atari Mega a complete set of TCP/IP protocols and allocations which have been tested for compliance with DDN/DARPA Internet Protocol specifications.

MORE DESKTOP PUBLISHING

From Timeworks comes the Timeworks Desktop Publisher ST. Retailing for $129.95 this GEM-based program will offer WYSIWYG display, over 1,200 possible type-style combinations, ability to import graphics, and laser printer compatibility. Desktop Publisher ST will be available in the first quarter of 1988.

Soft Logik Corp. announced a new version of its desktop publishing program, Publishing Partner Professional. New features include automatic textflow around graphic images, automatic hyphenation and kerning, the ability to import documents from other word processors such as WordPerfect, First Word and Word Writer, more fonts and font manipulation. It will retail for $149.95.

From ISD Marketing comes Calamus, a page-layout and typesetting application. It allows outline fonts and vector graphics that until now could only be processed by expensive Postscript laser printers. Calamus uses these features on both the printer and screen. The screen output can be enlarged up to laser printer resolution. The program offers a spelling checker and hyphenated dictionary, object-oriented graphics, chart forms, and font editors using Bezier curves for designing or changing fonts. Calamus for the Mega will be available in December 1987 for $349.95.

MichTron offers GFA Publisher, a GEM-controlled program with full-featured text editor, automatic text flow and paging, expandable font library and an integrated driver for PostScript.

From Migraph comes the supercharged Easy Draw. And Supercharger, a companion product to Easy Draw, makes it easy to load graphics from popular paint programs. While not a desktop publishing program, these two combined products let you create newsletters, reports, brochures, etc. You can work with ASCII files, have justified and non-justified text, use onscreen grids and rulers and output to the Atari laser printer.

LET'S EMULATE

Turn your ST into a Mac with The Magic Sac Professional from Data Pacific. The Professional consists of three products: The Magic Sac Plus, the Translator One and the Magic Epson Printer Driver. The Translator One allows the existing Atari disk drive to read and write Apple Macintosh disks and convert data between Mac, ST and IBM PC diskette formats. The Professional is shipping this month with a suggested retail price of $449.95. Typical Mac programs you can run are Macpaint, Macdraw, Excel and Pagemaker.

PC-Ditto is a software-only utility which taps the power of your Atari ST to imitate an IBM PC XT. Programs you can run include Lotus 1-2-3, Enable, Sidekick, Framework and Symphony.

WORD PROCESSING -- ALIVE AND WELL

WordPerfect for the ST is out and is called by some the Cadillac of word processors. In addition to a built-in thesaurus and spell-checker, the program has math functions anc can create indexes,and tables of contents. There are also macros, merge functions and onscreen columns. The product is shipping now for about $395 list.

From Microsoft comes the long-awaited Write, marketed by Atari Corp. It handles complex business reports as well as memos and letters. It has all the standard text generation, editing and formatting features such as cut-and-paste, creating footnotes, automatic pagination, different font styles and sizes, and it works in conjunction with the Atari Laser printer.

MORE CAD PROGRAMS

Drafix, from Foresight Resources, is now on the market and drawing critical acclaim. It's identical to the 1.00 IBM PC version, supports pen plotters, and runs on color and monochrome Atari monitors.

Coming soon from Migraph is M/CADD, a professional engineering graphics design system for the Atari Mega. M/CADD outputs directly to HPGL-compatible plotters and saves in GEM format for output on 9- and 24-pin dot-matrix printers. M/CADD files can be loaded into Migraph's Easy Draw, and you can add more text and either bit-mapped or object-oriented graphics. Suggested price is $499. M/CADD should ship the end of November.

With MichTron's Master CAD, you can produce object in 2-D and 3-D using its exclusive concepts of Projection Planes. It uses pull-down menus, dialog boxes, mouse and very few keyboard commands. Expect to see this in early 1988.

DESKTOP VIDEO

From Antic Software in conjunection with Sony comes a desktop video package. Sony's low-cost 8mm video hardware and Antic's video sequencer software create professional-quality 3-D computer-graphics videotapes of up to two hours. The Antic software controls nine functions of the Sony VCR, then adds its own special visual effects such as fades and auto assemble/editing. The 8mm video sequencing software (including custom parallel cables) will be available in January 1988 from Antic Software. The Sony video equipment is available from Sony.

MORE GRAPHIC FUN

From Neriki Computer Graphics PTY Ltd. in Australia comes the ZImagemaster, software with a hardware box to attach to your ST. Hooking up the Polaroid Palette can output DEGAS pictures as Polaroid pictures, And you can hook up a 35mm camera to the Palette. The package yields overhead transparencies and printouts. It will retail for $400.

Antic Software is also showing Spectrum 512, its 512-color paint program, which expands the ST's normally limited palette of 16 colors to 512. Spectrum 512 can load and enhance pictures from existing ST software as well as from Amiga picture files. Available now for $69.95.

Animation comes from Antic Software as well with Cyber Paint, also $69.95. It emulates the functions of a $100,000 Quantel Paintbox -- but

for computer graphics instead of live video. Cyber Paint is a member of the Cyber family of desktop video products. Its many features include smooth raster tweening along any 3-D path, professional optic effects with planar rotations through 3-D space, and moviola-style cut-and-paste.

MORE BUSINESS BITS

The Informer from Regent Software is a multi-table database with presentation graphics. Easy-to-use point and click functions let you create and manipulate up to four databases at once. You can import graphics from DEGAS and NEOchrome... From SBT comes the Database Accounting Library, menu-driven with options to confirm, change or cancel entries... Hi-Tech Advisors announces Super Sales Pro, a full-featured point-of-sale inventory control software system for the ST. It will accomodate medium- to larger-sized wholesale, retail or mail order businesses. The company will provide free technical support... From Progressive Peripherals comes Superbase Personal, a relational database, and the Logistik time/project management system... B.E.S.T Inc. offers B.E.S.T. Business Management, an integrated accounting system offering general ledger. Available now, suggested retail price is $395... ISD Marketing, which brings you the well-known VIP, now has the MasterPlan financial spreadsheet featuring the GEM environment with pull-down menus, icons, scroll bars and column grabbers. It offers graphics features as well. Also from ISD is an update to STAccounts, the integrated accounting package... From Royal Software comes additional low-cost business programs such as Help Calc, templates for their E-A Calc and VIP. Coming soon will be Inventory Master for $99.95.

MIDI

Hybrid Arts was showing ADAP and ADAP 2, the digital editing system. ADAP 2 works directly with a hard disk. Also just released is Easy Score, Hybrid Arts' new scoring program.

NEW HARD DRIVE

In mid-December ICD will ship its new 100 megabyte hard disk for $1,699.

48. COMDEX

Newsgroup: comp.sys.atari.st
Date: 1987-11-07 02:11:56 UTC
From: kemp@unsvax.UUCP
Message-ID: <183@unsvax.UUCP>
Source record: 256248

This is a test....

If you made it to COMDEX than you know that ATARI is doing
alright. I checked out WORDPERFECT for the ST and it truly
is an awesome piece of software. WORDPERFECT itself probably
had the most memorable set-up at COMDEX.

COMMODORE was there this year. Glad to see they could make it.
Their absence in the past was probably a big reason more
AMIGA'S didn't sell than could have.

More news later on this same station...

Hardware? Software?

And is Apple really considering a Un*x system? I find it hard to believe.
Isn't mail now considered an essential part of a _real_ computer running
Un*x? Oh well... Just thought this was funny :-) Apple will always
need outside help.

Send flames to /dev/null or at least the console where someone else has to
read them.

G. Onufer

PS. Anybody know the cheapest way to expand my 1040? I am in that market
now (memory that is...). BTW, anybody try WordUp yet? I have the Degas
Screen dumps of it that were posted to GEnie and they look good. I was just
wondering if anybody has _used_ it yet!

Anybody want to write screen drivers for microemacs that are as fast as
Tempus'?? That would be a way to make money (I'd pay).

I was at Comdex and talked to Jack Lang, Tim King, and Jessica Lang at length about this box. What I found out was quite enlightening to say the least, let me say this first, "This is a really neat machine! ", then let me say this second, "It ain't cheap, when you configure it like it Workstation, it costs like a Workstation." So before I go on lets add some numbers to these statements :

At the show the Perihelion folks were saying $2K for the ABAQ (Ay-bak) and you had to have a Mega ST as well ($1.5K - $3K depending on which one you have) and a monitor that can display the images your interested in ($.5 - $3K, where 500 gets you a Multisync, and 3K gets you the multisync II plus which can display 1K X 800 pixels), plus you really need a hard drive so add another 1K to 1.5K depending on size (20 - 40Meg) So minimum we're talking $5K to get a low-res color system with a 20Meg hard drive, upto $8K for a 40meg High res systems (which is cheaper than either a Mac II or a Color Sun). When the 'real' machines become available the ST will be optional (and hopefully they will have redesigned the clunky case) but they were murmering $5K sans monitor or hard drive. So for those of you who want a Workstation for the cost of an Amiga or ST will have to wait a few more years for the technology steamroller to get a little be farther down the road.

As for the machine it was running some neat demos that primarily showed off it's color capabilities. Since they were 'canned' images being replayed aka ShowAnim or some other framebuffer animator it was not clear how fast the actual machines were. One was running GEM on a 19" 1K X 1K monochrome desktop, unfortunately most GEM applications couldn't really hack the huge screen. I would be interested to know if Atari will be supporting both GEM and Helios on the machines (all the really good questions hit you after you've left the booth. :-)) from the looks of it, it did not appear likely. The Perihelion people were quick to point out that the slaved Mega was only providing I/O services and non of its memory was being used by the ABAQ. So I assume if you wanted to run GEM you would

either emulate the 68000 or use a version of TOS in ROM that passed all video requests on to the ABAQ.

Other interesting tidbits; the video memory (1 meg of video rams) was separate from the ABAQ's program memory (shown with 4 meg). The internal slots will accept boards with additional Transputers or memory on them so you could continue to beef up this thing. And while some of the Demos were written in Occam (INMOS's transputer language) Perihelion was going to support C as the primary development language (what no BCPL?). It also had a custom blitter that apparently was really fast however only the demos were available so I couldn't really test drive them all that well. Overall it looks like an interesting box and is probably going to excite a lot of graphics folks. I don't see a whole lot of them making it into the mythical home market, or the ever lucrative business market. If Inmos has really conquered its manufacturing problems and Helios lives up to its advance billing this should be worth a look at least. And while there were boxes to play look at, at the show, I know that more than half the work will be in the software.

So things to watch for :
o How Atari 'positions' this product. Depending on when it gets out the door it will be competing with 386/486 boxes, Mac IIs, and Low end Suns.
o What happens to the various ST owners. (In my opinion they should split their product line like the Apple II/Macintosh computers are truely separate.)
o Messages from people who have machines to play with of their own (I am of course available for Beta Testing :-))

Sorry it dragged on so long, it was one of the more interesting aspects of an otherwise PC/386/Laser Printer dominated show.

Cross-posted to: comp.sys.mac,comp.sys.atari.st

FreeTerm 2.0 which was recently posted to the MacIntosh binaries group doesn't appear to work using the MagicSac on the Atari ST. This seems strange seeing as the Data Pacific folks tout FreeTerm 1.8 as *the* terminal package to use with the Sac.

Does FreeTerm 2.0 work with version 4.5x of the MagicSac driver?
(I am using 4.36 -- latest from CompuServe)

Any help would be appreciated.

>
>-The new version of the ROMs is incompatible with a fair bit of software
> (if this is true, how much, what great programs won't work?)

Not much doesn't work. I've heard reports of 1 commercial game
and 1 public domain terminal program. Hundreds of programs were
run successfully, including everything I really care about (Flash!
and Cyberpaint :-).

OS-9 runs without problems.

>
>-The disk drives are new, and won't read much protected software
> (again, how much and what major programs)

The one game program that has been reported to have problems
was copy protected and it's thought that the copy protection had
something to do with its problem. (This info is a condensation
of info from BIX). There may be others.

>
>-Many people say 4 megs is just too much, you never need it all, it is
> a waste of time and money, that it's better to buy a 1040 ST or maybe
> a Mega 2 ST.

Funny. I could use 4 Meg. right now. If the people you talk to
can't that's their problem. Keep in mind that before the coming of
"memory resident" programs, the PC world kept thinking that 128K was
wonderful. In fact, right now some of them scoff at higher than 640K.
Not many, but some. What things benefit from higher memory? CAD 3D.
2 Meg. will do the job for a lot of things, but it's definitely a
memory eater. I have no doubt that I can overrun 2 Meg. I've seen
how easy it is to overrun 1 Meg.

CyberPaint. CyberPaint more than any other program is going to
sell BIIIIIG MEMORY. I llllove CyberPaint! It's Wonnnnnderfullll!
:-) It's just about the only thing worth doing with any ST aside
from Flash! and a good modem!

You'd better get a double sided drive if you don't have one.
If you want a good stock market tip, buy any company that's into
storage media. CyberPaint is going revolutionize the concept of

Home entertainment! Get streamer tapes if you can. You'll need them!

If you're in the Toronto area check out my *short* demo of CyberPaint called "Lucky Penny". It's 40 frames of stop-action digitizing intended to be run at 1/4 sec. framing rate. (10 sec. run time). The difference between this and most other demos you'll see this year are: 1. a real story line -- not much of a story, but more than the "lava lamps" and straight advertising you'll see running otherwise. 2. It *may* be runnable on a 512K machine, but I'm not sure -- time to work on the demo stopped me from pushing it further. I *could* have used more and made it better. 3. A real Television Star! Kevin Frankoff has had 2 kids shows in Canada and has appeared in numerous commercials. My thanks to him for appearing in this "short subject". He's an incredibly talented actor, formerly with Second City (stage). If I can talk him into it, I hope to get something a bit more creative in a future "short" -- now that we know the range of the hardware.

OS-9. OS-9 gives you may ways to run optimally in almost any size system. The smallest systems which are useful, in my opinion are, 520ST with 2 drives (at least one double sided) or 1040ST with an extra drive. With OS-9 and 4 Meg. you can start off by preloading *all* your executables (*not* the same as using RAM disk because, like "memory resident" programs in GEM/TOS, they aren't moved around to be run -- they run where they are), *and* a 1 Meg RAM disk on top of that for data files. You'll still want another drive, but there we've wacked out a good couple of Meg already! You'll still want another drive for convenience doing backups, but it'll be less necessary. On a Mega, you'll be able to add a few serial ports and have and incoming "mail drop" under OS-9 24 hrs./day. The ability to run a BBS and still use your computer will be a reality. How about 1 line for personal "mail drop", and 1 line for outgoing calls and *2* lines of BBS? From what I've heard, there will likely be a 4 serial port card available from 2nd sources early next year.

Editing Large Files: With almost any text editor, and in the case of MicroEMACS, multiple large files at one. Do I ever have over one meg. in a textfile? No, but I have had software source "kits" with over 2 meg. New text editors with multiple buffers will use this better than they do now.

AI. I know of 8 Meg. sources in the AI field. Yup, I can see usage for *beyond* 4 Meg. already!

I have also revised my thinking on the Laser printer/Mega ST combination. Having done a lot of work digitizing lately, and talking with magazine publishers, the combination sounds like a G*d send! Picture files cannot be sent quickly to printers across standard serial ports. Even Centronics is quite slow in this regard. I'll be interested in seeing the speed of

this system. If they can beat Centronics speed, they'll move
mountains in the publishing industry (note that I don't use
the stupid "desktop" adjective -- just "publishing").

>
>I hope these are for the most part untrue, because I was looking forward
>to 4 megs of Mem with the new ROMs and the blitter. I hope some of you
>guys can set me straight on these things

Yes, it's worth it. I recall the silliness of 6502 machine users
when we were breaking the 64K barrier. "Who needs it?" For some
reason CP/M people didn't seem to doubt the advantages of larger
systems quite as much. Yes, we still heard the "who needs it?"
from them, but not quite as much. I've heard the same from
IBM-PC users looking at greater than 640K. Answer: If you don't
want it, you'll never need it. Think about that one for a
while. Sounds really Zen right? :-) Have fun deciding!

Cheers! -- Jim O.

Maybe a little tiny misunderstanding here...

The Spectrum 512 that most people refer to is the Spectrum 512 slideshow
which _is_ public domain. It shows all of those fantastic colors too.

It is available on GEnie and Neil (Harris) has posted at least 15 nudes
which were digitized by someone else. From what I have seen, feel free
to distribute the slideshow (but check first, it _is_ on GEnie). Would
anybody be interested in the slideshow program and a few pictures on Usenet
to see what this puppy does?

The way they look at it, free advertising, eh? ("See all the pretty
pictures? You mean I can do that too? Where can I buy the program?")

The Spectrum drawing program is _not_ public domain and is available
throught The [Antic] Catalog.

> (Well, not really...but I would very much appreciate a response.)
> What am I not doing correctly? (Or, conversely, what hasn't Soft Logic
> told me to do?)
> - Rob DeMillo

Thames, Spokane and Devoll are in Font Disk #1 from SoftLogik. I got
it for $19 from Software Discounters of America (very good store).
With PP v1.02, you get System, Helvetica and Times SCREEN fonts, but
only Helvetica PRINTER fonts. All font disks (SOftLogik's or Font Factory's)
comes with SCREEN and PRINTER fonts.

I just learned that the TIMES printer font is NOT public-domain as I
incorrectly stated previously. TIMES and a bunch of others are put out by
Font Factory. Each disk is about $20 thru mail-order.

Columbia, Hudson, and Saturn ARE in public-domain. So is University-Roman.
BTW, a few of the fonts (including Devoll and Thames) do not generate
the greater-than and less-than signs.

Also, test a couple of other printer drivers. I have a PANASONIC 1091i
and the readme file suggests the MX80f driver. However, I've found the
FX80F to be significantly better when it comes to printing text. For
normal text, point size of 10 seems to generate the best print. Helvetica
at 10 ps is INCREDIBLY awesome on the PANA1091i (close to laser print!!)

61. Gulam (Beta Test Release)

Newsgroup: comp.sys.atari.st
Date: 1987-11-08 20:02:43 UTC
From: pm@mandrill.CWRU.Edu
Message-ID: <2305@mandrill.CWRU.Edu>
Source record: 256061

A few days ago, I sent the beta release of Gulam shell to turner@daisy.
He will be posting it to the net soon. To help you decide if you care
to save the uuencoded archives, here is a short description of the
present state of Gulam.

Gulam is a shell written and copyrighted by pm@mandril.cwru.edu; it
is (and will be) distributed free of charge. It is not warranteed; on
the other hand, I and many others find the present implementation
eminently useable, and indeed use it all the time, in preference to
other shells.

The present beta-version (dated Nov 1987) is a result of fixing bugs,
internal code improvements, and user-visible improvements. Gulam.prg
is about 88200 bytes, and gulam.doc is about 78000 bytes. Users are
encouraged to tell me both good and bad things about this program.

Here is a list (complete?) of things new and/or diffrent from the
alpha-version.

1. the bugs causing memory-lossage have been fixed.
2. an application program can now call one of *Gulam*'s routines
that is equivalent to system() call.
3. an application program can now call one of *Gulam*'s routines
that can receive keyboard input from the user, with all the facilities of
`ue', and return the line input by the user.
4. `ue' can now insert-file.
5. stdout append-redirection (`>>') is now implemented.
6. a new sub-word consisting of three dots `...' expands to the list
of all filenames rooted at the current or given directory.
7. doing a `set path <path-list>' will also cause an automatic
`setenv PATH <path-list> ; rehash'.
8. `ue' can now fill-paragraph.
9. new shell variable `verbosity' controls how silent *Gulam* is.
10. cp will not copy directories and their contents unless
given the `-r' flag.
11. `ue' can now use mouse movements as cursor
movements (see mscursor).
12. diskettes can be formatted (single/double-sided) in TOS standard way.
13. the command mem can not only report the GEMDOS free-list but also the list
of GEMDOS Malloc-ated chunks.
14. shaded background on the screen is provided for the `gem' command.
15. the keypad keys can be toggled to become numeric
or extra-function keys.
16. there are 3 separate key-bindings for the one *gulam* buffer, and
the one *mini* buffer, and all the regular buffers.

62. CAD 3D file formats & libraries...

Newsgroup: comp.sys.atari.st
Date: 1987-11-08 20:27:17 UTC
From: UD140469@NDSUVM1.BITNET
Message-ID: <431UD140469@NDSUVM1>
Source record: 256062

[a line to be eaten]
Here's a question to the CAD 3D owners out there... I don't have CAD 3D yet, and while I am interested in getting it eventually, right now I'm more interested in getting objects created with it--I'm working on a system here at my school with some really wonderful graphics hardware but virtually no pre-drawn objects, and a pretty crummy CAD program. What I'd like to do is take object files from CAD 3D and run them through a converter to convert them to the file format my system needs. Here's the question: does anyone have info (or does the CAD 3D documentation) on the format of CAD3D files? Question two: does anybody know where libraries of CAD 3D objects (preferably PD) can be had? I'd really appreciate this information.

Scott Udell
UD140469@NDSUVM1.BITNET

P.S. I'd be interested in getting objects from any other 3D wireframe CAD programs out there (along with file/object formats), so if you have the info (even if it's not on an ST), I'd really like to hear from you.

[a line to be eaten]

As far as I can tell, it's up to you. The "F" functions are probably a bit faster, since they're just #defines that jump you right into the system stuff; the "f" functions, while it is true that they're more compatible with other environments, will probably be a bit slower since they go through some translation routines first. However, any extra time that the "f" functions take will probably be so small (as in less than a hundred machine instructions) that it won't matter (especially since the functions take forever, anyway, since they all need to do disk I/O). Anyway, there's your difference.

64. bug in xprolog 2.0?

Newsgroup: comp.sys.atari.st
Date: 1987-11-09 01:51:55 UTC
From: aoki@postgres
Message-ID: <4811@zen.berkeley.edu>
Source record: 256064

My copy of Xprolog goes into an infinite loop when you try to execute an undefined function. Gee, I *thought* it had unpacked OK....

In addition, I had a rather odd experience while getting it to run on a 520ST (with a single single-sided disk). It wouldn't produce an image file until I reduced each parameter by some incredibly miniscule amount (1 functor, 10 bytes, or some such). The complaint was something like "I can't create such a large image file", and it must have been meant "too large" in terms of memory 'cause the resulting disk file was pretty small.

Any comments? Has anyone else run into these problems? Or am I just a pinhead? Well, I must be a pinhead, I bought an ST to begin with... :-)

65. Hard drive problems

Newsgroup: comp.sys.atari.st
Date: 1987-11-09 02:13:35 UTC
From: med@druhi.ATT.COM
Message-ID: <2351@druhi.ATT.COM>
Source record: 256065

Well, I'm at an impasse with this silly drive, and am asking for
any help... What I have:

1) A working 20Mb Supra drive with an internal Rodime SCSI
drive.
2) A bare 20Mb drive that I hope to soon have working as
a secondary drive.
3) An ADAPTEC 4070 SCSI to RLL controller.

What I've tried:

1) I have replaced the 50-conductor internal SCSI cable in
the Supra drive with a cable similar but with yet another
50-pin SCSI connector which attached to the ADAPTEC 4070.
2) 20-pin and 34-pin cables between the ADAPTEC 4070 and the
new drive.
3) The Adaptec 4070 has been selected as SCSI ID #1.

The symptoms:

1) When the SCSI cable to the ADAPTEC controller is
disconnected, the Supra drive works fine.
2) When the SCSI cable to the ADAPTEC controller is connected,
the BUSY light on the Supra remains lit, and the Supra will
not spin up or function at all. The second drive will not
spin up or function either.

I recently saw an article in the ASTUN newsletter that was written
by someone at Supra, regarding attaching additional drives to their
controllers. Unfortunately, I can't seem to lay my hands on that
now.

Any suggestions or hints would be greatly appreciated.

The GEMDOS Fread(), etc are more similar to the UNIX read(), etc,
NOT fread(), etc. The raw GEMDOS functions are faster (due to
no buffering) but you should set up your own buffering. (I found out
that a 9Kbyte buffer is good enough for almost-maximum floppy-disk
performance.) If you want to write code so that it is easy to port
to UNIX and such, write read(), etc calls in the UNIX syntax, and
set up a bunch of routines with those names that simply translate
to the GEMDOS calls. (BEWARE of int-vs-long problems!)

- Moshe Bran.]6

67. HardDisk woes, Part II.

Newsgroup: comp.sys.atari.st
Date: 1987-11-09 04:59:08 UTC
From: csrobe@nh.UUCP
Message-ID: <8711090459.AA01814@nh.wmcs.uucp>
Source record: 256067

Hard Hard-Disk times have struck me again. Ode to my Supra 20meg.
It seems that I am having a subset of my original problems (for those
of you that remember the first round). Anyway, I would like to ask
the net if anyone has any ideas. Here goes...

First symptom --
Sometimes it takes approximately 25 to 30 seconds for the harddisk to
start its spin-up after the power switch is turned on. Normally, the
disk starts to spin up after 2 or 3 seconds. This started about three
weeks ago.

Second sympton --
When trying to read a file (the latest case was flash.prg from
d:\bin\flash) i get the "Data on disk in drive d: may be corrupted...."
dialog box. (i just reformated my disk and before the reformat, i
saw this message several times on drive e:). I could click on retry
and the file would finish reading. This time i was able to recreate
the problem -- all I had to do was try to load flash from anywhere, from
either shell - Gulam or GEM. I tried reseting the machine via the reset
button, but the problem didn't go away. The more the error occurred
the more retries it took to read the file. I finally stopped at 5
retries. Once i powered off my ST (i never powered off my Supra)
the problem disappeared. Now, i don't know where it will appear next.

My harddisk is partitioned into 4 5meg partitions (C: - F:) -- so far
C: over 3 megs free, D: has somewhere around 3 megs, E: has almost
5 megs, and F: has all 5 megs. I have installed the forty folder fix
foldrxxx.prg as foldr100.prg and after boot-up and loading accessories,
I have over 640K of RAM left.

All along I have suspected my harddisk, but now I'm not sure since
powering off my ST made the problem (at least the recurring one) go
away.

Flash-back: (for those unfamiliar with my old problem) I had a heat
problem that caused my machine to just wind down and the busy light
would come on as it did today. This would happen whether I was doing
anything or not, whether it was connected to a machine or not. It
also occurred more often when the weather was warm. (NB: today was
a nice warm day too -- 80 degrees, the warmest it has been in a while.
I also had the most wind-downs that i have had since getting the drive
back about 3 months ago.) If it was the heat, then why did powering
down my ST make the problem go away?

Please, can anyone give me some educated guesses as to where the problem
is and how i can fix it? has anyone experience this problem before?

thanks,
-chip

68. TDI Modula-2 V3.01

Newsgroup: comp.sys.atari.st
Date: 1987-11-09 05:34:00 UTC
From: LAWS@rsre.mod.UK
Message-ID: <08.NOV.1987.21
Source record: 256068

Robert,

Ref your enquiry in INFO-ATARI16 about corrupt/missing files in the commercial version of TDI Modula-2.

I do not have V3.01 but did check the V3.00 I have in the UK. None of the files you listed were missing or in error (well they all compiled).

A bug I have found in V3.00 is that I cannot IMPORT the procedure SIZE from the module SYSTEM - have you or others seen this in V3.01?

John Laws

69. Danger in BIGFORMA.ACC

Newsgroup: comp.sys.atari.st

>problem. However, READS/WRITES appear to be slower for diskettes so formatted
>when compared with the FAST format using Dcformatter.

The BIGFORMA.ACC is highly suspect.

It formats 11 sectors to a track (just!) and there are 0 to very
small gap bytes between a preceding data sector and a following
ident sector. In consequence and depending on drive variation /
performance, there may be an over-writing of the following ident
sector when writing the data sector.

The start of track 0, the ident sector and start of sector 1 -

```
0000 89 C9 C9 C9 C9 C0 00 00 00 00 00 00 14 A1 A1 ................
0010 FE 00 00 01 02 CA 6F 4E 4E 4E 4E 4E 4E 4E 4E 4E ......oNNNNNNNNN
0020 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 00 00 00 NNNNNNNNNNNNN...
0030 00 00 00 00 00 00 00 00 00 01 14 A1 A1 FB 00 00 ................
0040 00 00 00 00 00 00 B0 C5 14 73 FF E7 E7 F3 FF E4 .........s......
0050 7F FE 67 C0 13 C3 FF 83 FF E7 FF FF FF FF FF FF ..g.............
```

The end of data sector 1 leads into sector ident 5 and data
sector 5 -

```
0230 FF FF FF FF FF FF FF FF FF FF FF FF FE 60 C0 00 .............`..
0240 80 00 00 00 00 00 14 A1 A1 FE 00 00 05 02 06 AB ................
0250 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E NNNNNNNNNNNNNNNN
0260 4E 4E 4E 4E 4E 4E 00 00 00 00 00 00 14 A1 A1 FB NNNNNN..........
0270 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 ................
```

Finally the final data sector (8) stops just before the end of
the track -

```
1860 00 00 00 00 00 00 00 00 00 DA 6E 4E 4E 4E 4E 4E ..........nNNNNN
1870 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E NNNNNNNNNNNNNNNN
1880 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E NNNNNNNNNNNNNNNN
```

Sectors are written from the index mark as 1 5 9 2 6 10 3 7 11 4
8. This is the cause of slower performance.

track: 0 side 0: 11 sectors side 1: 11 sectors

> Is there a prefered choice? How do you choose?

The capital F functions are GEMDOS functions, similar but not identical to UNIX system calls. That is, Fread is similar to read, Fseek is similar to lseek.

The little f functions are STDIO library functions, identical to standard IO library functions everywhere. (Or at least as close as MW could make them.) That is, fread under MWC on an Atari does exactly what fread under UNIX on a VAX does.

If you want to write portable code, I suggest using the little f functions from the standard IO library. They're standard. :-)

If you need more control over exactly what it going on, use the capital F functions from GEMDOS. If you port something that close to the machine, changing a function name from "Fssek" to "lseek" will be the least of your problems.

This is not the whole story. Recently, for various reasons, it seems that people have sent things to the moderator of these groups and they are not getting distributed. I was happy to see the DCfmt programs posted to this group. There is no other group for the *sender* to post them to this net.

As you may know, I have called for a change of rules in posting to the two groups,

comp.binaries.atari.st
comp.sources.atari.st

I think that no overall benefit has come to users by having these groups be moderated, as they are now. The author of some slick new program should be able post there and not bother you. Please add your voice of support for my position, and I will add mine to yours.

> I'm just as interested as
> the next person in obtaining these programs, but PLEASE let me
> do it in my own time from one of the file servers!!

The file servers are still not *easily* accessible to users outside the BITNET world. Yes, I can get files, but it is still a struggle for me, on a non EBCDIC system that does not run TRUE BLUE software, to decode these things because of the use of LRECLs, problems with character translations, and the use of files with very long lines. Things that have appeared on the net as nice flat files readable and decodable are now stored in a form that is a nightmare to work with.

Farrel proceeds to give an explanation which is basically correct; however
he makes the following oversight.
> The compiler is probably confused because it expects some form of assignment
> to be taking place at about that point, as in "ch = *p++;" which increments
> "p", and assigns the thing now pointed at by "p" to "ch".

Not so. This makes the assignment first, and then increments the pointer.

I don't quite understand this. If I have to do my own buffering with Fread, while fread does the buffering for me, then the fread call appears easier to use. And since the application has to buffer Fread calls itself, any speed advantage of Fread (due to no buffering!) is negated. So I can see no advantage to the Fread.

From your posting, I gather that you use the capital F's rather than the small f's. Moshe, could you please clarify this.

I totally disagree.

One current problem is the slow turnaround from repair centers lacking in
spare parts.

Having the dealer carry a substantial inventory of these is a good way to
ensure that our consumers get prompt service.

Here's the press release that describes the new Atari announcements at
Comdex Fall 87. We'll get you more detailed information ASAP.

FOR IMMEDIATE RELEASE

Amidei And Company Atari Corporation
Paul Gross Neil Harris
Hunter Gooch (408) 745-2160
(415) 788-1333
orporation emerges as a maker of a varied line of

high-performance, low-cost solutions for the business world.

New technology is showcased by Abaq, an
processor. The parallel processing capability of Abaq lets a single

system multiply its processing power by adding extra transputer chips.

At answer is "Moses PromiseLAN". This system is

compatible with the NETBIOS standard used by IBM and Novell. It

communicates data at 1 megabits-per-second to PC's and over 250K bits-per-

second over Appletalk. Atari is planning to manufacture "Moses

PromiseLAN" adapters for the Mega, ST, and PC computer lines.

The Atari Mega computers are showcased with a variety of solid

business solutions.ect ST t's Drafix 1.

Atari expanded its PC-compatible offerings by adding two new models,

the PC2 (PC XT compatible) and PC3 (PC AT compatibile), both with EGA

graphics, high clock speeds, and low price tags. A variation of the PC3

will operate in VGA graphics mode as well. The PC2 and PC3 will be

offered with 3.5" or 5.25" floppy disks and with hard disks. These new

models join the PC1, which at $799 is a basic 512K PC XT compatible,

suitable for usecan do the things they

do best."

Atari Corporation is a leading, vertically integrated manufacturer

and marketer of personal computers and video games. The company offers

the 16/32-bit ST and Mega personal computers; the 8-bit XE

Going to try this again:

FOR IMMEDIATE RELEASE

Amidei And Company Atari Corporation
Paul Gross Neil Harris
Hunter Gooch (408) 745-2160
(415) 788-1333

CONNECTIVITY, SOLUTIONS, AND TECHNOLOGY:

ATARI ANNOUNCES NEW PRODUCTS AT COMDEX

(Las Vegas, NV -- Comdex Fall 87)... In a series of major product introductions, Atari Corporation emerges as a maker of a varied line of high-performance, low-cost solutions for the business world.

New technology is showcased by Abaq, an ultra-high-performance workstation with blazing speed and dazzling graphics. The Abaq, based on a sophisticated "transputer" chip, runs more than 10 times faster than a PC/AT technology and more than 5 times faster than the 68020 with math processor. The parallel processing capability of Abaq lets a single system multiply its processing power by adding extra transputer chips.

Atari unveiled its new CD player capable of reading CD-ROM disks and of playing musical CD disks. The CD-ROM is supported by a Mega and ST-compatible DMA interface, and will retail in early 1988 for well under $1000.

Atari's connectivity answer is a LAN which is

compatible with the NETBIOS standard used by IBM and Novell. It communicates data at 1 megabits-per-second to PC's and over 250K bits-per-second over Appletalk. Atari is planning to manufacture "PromiseLAN" adapters for the Mega, ST, and PC computer lines.

The Atari Mega computers are showcased with a variety of solid business solutions. Desktop publishing is represented by both the Atari SLM804 Laser Printer and by G.O. Graphics, who are porting their Deskset program (CompuGraphics compatible) which Atari will market. Word Perfect is displaying the recently shipped Word Perfect ST and Atari is displaying Microsoft Write. A group of vendors are appealing to VARs with vertical packages running under the IDRIS multi-user multi-tasking operating system. Several new high-end CAD packages are on display including Foresight's Drafix 1.

Atari expanded its PC-compatible offerings by adding two new models, the PC2 (PC XT compatible) and PC3 (PC AT compatibile), both with EGA graphics, high clock speeds, and low price tags. A variation of the PC3 will operate in VGA graphics mode as well. The PC2 and PC3 will be offered with 3.5" or 5.25" floppy disks and with hard disks. These new models join the PC1, which at $799 is a basic 512K PC XT compatible, suitable for use as a LAN workstation and for standalone personal computing. The PC2 includes XT-compatible slots, while the PC3's slots are PC AT compatible.

"We offer complete systems for the office," said Atari president Sam Tramiel. "I can see Atari Mega computers with laser printers as desktop publishing stations exchanging data with a satellite group of PC1's as LAN stations. An entire office environment can be created. The PC, the Macintosh, and the Atari computers co-exist. Each can do the things they do best."

Atari Corporation is a leading, vertically integrated manufacturer and marketer of personal computers and video games. The company offers the 16/32-bit ST and Mega personal computers; the 8-bit XE line of

personal computers; the Atari PC; the 2600, 7800, and XE video game

system; and a broad line of peripherals and software.

Atari Corporation is located at 1196 Borregas Avenue, Sunnyvale, CA

94086. Telephone (408) 745-2000.

80. DIY 3.5" drive query

Newsgroup: comp.sys.atari.st
Date: 1987-11-09 20:30:34 UTC
From: toml@xrxns.UUCP
Message-ID: <236@xrxns.UUCP>
Source record: 256080

hello out there... i hope i am not adding to the clamor of people
crying out for help with 5.25" drives; this is actually a different
question. i would like to have an external 3.5" DSDD floppy drive
to go along with the one already inside my 1040ST. i do not, however,
desire one bad enough to pay the $200 plus which atari dealers seem to
want to charge. i do not mind a little hardware hacking, and don't
mind scabby looking assemblies with wires hanging out all over them.

the question(s): who out there has actual experience with roll-your-own
3.5" floppy drives? how much should i expect to spend for a drive,
and where to get it? where to find technical info on the atari external
floppy interface (abacus book?)? any interface electronics necessary?
any caveats? (i believe i've heard about some 3.5 inchers which can't write
as many tracks as some others - what to beware of?)

i would like to do this for under $100, if possible - is this out of line?
i already have plenty of power available from an external power supply
used for my DIY hard disk setup.

i'd greatly appreciate hearing from anyone with experience in this area.
and yes, i admit it, i'm also interested in 5.25" interfacing too, if you
have $0.02 on that topic too/either.

since the demise of seismo you may have trouble reaching me; try me at

rochester!rocksanne!xrxns!toml

if you can figure out how to reach rochester.

thanks.

81. Supra, Idris queries

Newsgroup: comp.sys.atari.st
Date: 1987-11-09 20:31:00 UTC
From: FXDDR@ALASKA.BITNET
Message-ID: <8711100211.AA09905@ucbvax.Berkeley.EDU>
Source record: 256081

First: The comments on the net about Supra hard disks have been mostly positive. I may get one in the near future. Anything better available right now? We called ICD about their new line for the ST and they haven't completed FCC approval yet, so they aren't shipping.
I was looking through magazines for a detailed review of Supra, and could only find information on their old 10 meg disk. As I understand it the current models allow additional HDs to be plugged in to the first. What sort of connection is it: a DMA port passthru, true SCSI, or a HD controller output?
And who is a responsible mail order distributor (preferably west coast) for Supra?
We may see about the BMS board for some of the STs here, but for my own use I suspect the hassle of tracking down and hooking up compatible HD + power supply isn't worth the cost savings.

Second: Several months back, we called the people who sent out the flyer on ST Idris and they were maybe-sorta-almost ready to ship. I presume that they are in fact shipping now. How's it look? We are using Idris on another 68000 system, and it is fairly useable, though we don't have the latest version. We haven't upgraded because they want more than $1000 for the upgrade (!!??). I hope prices are more reasonable on the ST line. If there are any ST Idris users out there who feel like talking, I'd like to discuss it...particularly if you've used the other varieties of Idris.

Thanks,
Don Rice

>Why should a backup program be memorable?

Well, anything that fits my needs usually sticks in my memory a bit more
than this did. The package was white, I remember that much . . . And it
didn't do incremental backups. So much for that.

I guess I'll go with Turtle . . . I need some of the Magic disks from
Current Notes, anyway. Thanks to those who've sent me advice. Also, on
the subject of the monochrome monitor, well, I still need one, but my
original message seems to have created the false impression that I'll trade
my color monitor for a mono . . . no, thanks. Besides, they have these new
color monitors that seem a lot better than this one I'm using now. Look
for the contrast and brightness knobs UNDER the screen (which seems sharper).

> seem to perform essentially equivalent functions. To do simple file
> i/o, I could use the capital F's or the small f's to do essentially
> the same things. Is there a prefered choice? How do you choose?

The cap-F functions are OS calls, and the little-f functions are library
calls. If you use little-f functions, you are bound to the vagaries
of your library. In the case of Alcyon's GEMLIB, these vagaries
are actually debilitating bugs. I don't use GEMLIB's little-f functions.

Among the pitfalls you can encounter are: newline translation and redirection
problems. The cap-F functions all treat files as bags o' bits, with no
translation or anything. Many libraries translate \r\n in a file into
\n alone; this takes longer and may not be what you want.

Also note that the parameters are not in the same order: the guy who
wrote GEMDOS got it wrong relative to UNIX.

86. midi to rs232?

Newsgroup: comp.sys.atari.st
Date: 1987-11-10 03:51:00 UTC
From: AIPS@BRANDEIS.BITNET
Message-ID: <8711100411.AA12628@ucbvax.Berkeley.EDU>
Source record: 256086

here's my stupid question for this semester:

if the MIDI port is run by some sort of ACIA and is actually some fancy sort of rs232 port, could it possibly be reprogrammed a bit to be a "normal" rs232?

i'm an os9 user, and i would *love* to be able to have 2 terminals.

i've heard of some MTC people who have done this, and it was 2 jumpers and a couple of interrupt handlers. however, i can't seem to actually find these people. also, it allegedly was still hardwired to 31.5kbaud... i guess we have to burn another keyboard prom to change this to something useful with a modem?

any advice/information would be appreciated.

I had a very similar problem with my floppy drive a while back. From changing monitors too often without fully powering down both the computer and either monitor, I fried my DMA chip plus part of the floppy controller. If I remember right, it costed about $400 dollars. But the symptoms were the same as yours... the dialog boxes and all.

>
> Hey folks! I'm very much new to all of this ...

> 1. UUDECODE - I take it from my perusals of the network that UUDECODE is way
> different from ARC - but how different?

ARC is several things at once... It can combine several files into
one file, gives you a check sum, and, unless you force otherwise, will
compress them according one or another data compression method.

UUENCODE, is a program that takes as input any file (such as a ".TOS"
file or an ARC file, for instance) and produces another that contains
only printable characters. UUDECODE is the inverse of UUENCODE.

If I understand correctly, the use of XMODEM requires use of all 256 8-bit
characters to do a transfer. This may be OK if you are calling from your
computer to another via one direct phone link, as well as
in some other circumstances.
However, some networks, for their own purposes,
respond to control characters, and for that reason, folks have
settled on schemes that move only printable characters. (Hence UUen-
and UUde-code.) Even this has caused some problems because *some*
machines that come in BLUE boxes and use EBCDIC codes are a bit out of
sync with these that use ASCII codes.

> 2. UNITERM - I've seen this mentioned a few times.
> From what I see it seems to be pretty good. Does it have KERMIT?

Yes it is great, and yes, it has KERMIT.

All our mainframes here run KERMIT, even those that come in BLUE boxes.

As was mentioned in a previous posting, Uniterm 2.0 is NOT out yet, but will be very very soon. So you panicky guys did not missed any postings.

Uniterm 2.0BETA version can be obtained from the server at Houston, although I'm not sure if it's supposed to be there. Since the official version 2.0 will be out very soon now, I think we should just wait.

As i mentioned in my posting of BIGformat.acc, it worked fine for me on my monochrome although the read/writes are slower. I've used it for about 2 months now, mostly for storing documents and misc stuff. If it caused trouble for anyone, I hereby apologize. I posted it because I got quite a number of request from fellow-netters.

Anyone out there using publishing partner together with Beckemeyers' C-SHell or GULAM? Please email me. Thanks

I don't know what the current status of the PC version is.

93. Re: FILE I/O

Newsgroup: comp.sys.atari.st
Date: 1987-11-10 19:04:10 UTC
From: braner@batcomputer.tn.cornell.edu
Message-ID: <2892@batcomputer.tn.cornell.edu>
Source record: 256093

[oops...]

What I meant was that reading a big block is a lot faster than reading char by char using fgetc() and such (getc, getchar). If you are going to read a big block you might as well use low level calls (Fread) for maximum speed. But I guess you _could_ use fread() as supplied by your compiler vendor. Just hope they implemented it efficiently...

One more warning: if you use a compiler with 16-bit int's (as it should be on a 68000!) you are limited as to the amounts you can specify in the count arguments for fread(), malloc(), etc. You _have_ to descend to the raw OS calls if you need to use a long count.

> The raw GEMDOS functions are faster (due to
> no buffering) but you should set up your own buffering.

Amusing. If the raw GEMDOS functions are faster due to not
buffering, why would you want to add buffering?

In fact, the raw GEMDOS functions are only faster if you do huge
read/write requests, and even then the difference shouldn't be noticeable.
Try reading a character at a time.... or a line at a time... this is why
buffering exists.

>I don't quite understand this. If I have to do my own buffering with
>Fread, while fread does the buffering for me, then the fread call
>appears easier to use. And since the application has to buffer Fread
>calls itself, any speed advantage of Fread (due to no buffering!) is
>negated. So I can see no advantage to the Fread.

fread() USES Fread(). Using fread() means that more code is imported
from the C link library (or whatever languge you are using). Fread() is a
direct OS call. So if you are an application written in straight assembly,
fread() isn't available to you without setting up the proper enviroment...
done automatically by the startup code in, say, a C link library. fread()
would be a function IN that library. Or, perhaps, you want to save space
and make the executable as small as possible; in that case, you wouldn't
want to include the X Kbytes of code that stdio takes.

95. Re: Mega STs

Newsgroup: comp.sys.atari.st
Date: 1987-11-10 21:54:50 UTC
From: dclemans@mntgfx.mentor.com
Message-ID: <1987Nov10.135453.2113@mntgfx.mentor.com>
Source record: 256095

There are two major causes of incompatibility with the blitter rom's
(as used in the Mega ST's)

Essentially all of the "undocumented" low memory locations have moved.

A MAJOR bug in the read portion of the floppy driver was fixed.
This bug had two symptoms that people might have encountered:

error status might not be correctly reported after a read that
got an I/O error

If running a program that used BIOS calls to directly access the
floppy (for performance), multi-sector reads were not reliable

(assuming that the BIOS listing ATARI sent me as part of the developers
kit accurately represented the old ROM's, the bug was caused by mis-using
a WD-1772 sector read command).

From what I've heard, the floppy read bug fix is what has caused most
compatibility problems; it seems some manufacturers of copy protected
software (mainly games) based their copy protection on a side-effect
of the bug. Based on my experience the other areas aren't as major;
the only packages I know of that were affected were the "twister"
formatter that came from STart and possibly GFA basic.

==========

How much memory you want depends on what you do now, and what you
might want in the future. My system (4 megabytes) normally runs
with slightly under 2 megabytes free. The rest is taken by a 800K
ram disk, a LARGE disk sector cache, a large printer buffer, auto-loaded
programs, desk accessories, etc. The whole conglomeration boots in
under 30 seconds, including the time to load about 400K of files into
the ramdisk.

There are also software packages that want memory; the laser printer driver,
Smalltalk-80, OS-9, IDRIS, etc.

Source record: 256096

The difference between the current ST floppies and the 2 megabyte ones is similar to the difference between the floppies on an IBM PC-XT and a IBM PC-AT. Basically the clock rate is doubled, letting you pack in twice as much information.

The consensus among the hardware people I've talked to is that the WD 1772 that's currently in the ST can't handle a higher clock rate. However if you removed the 1772 from the motherboard and replaced it with a daughter board with appropriate clocks, controllers, etc. you could get the hardware set up correctly.

The software incompatibilities you'd see would include:

the desktop disk formatter and copier probably wouldn't work (but there are public domain versions of both of these available)

nothing knows about "switching" densities; i.e. you'd have to invent some way to dynamically change clock rates

>use these disks?

These diskettes write 80 tracks x 18 sectors/track. They require a special drive mechanism whose write bias is adjusted by a special pin on the cardedge. Similar to the way AT clones enable the 1.2MB 5.25" drives.

A friend and I recently tried an external high density drive (made by NEC) designed for AT clones. It could read 720K diskettes but little else. It could not read 1.4 MB PS/2 diskettes at all. Probably the controller is incapable of recognizing this format - DiskMech said the tracks were blank.

Perhaps these beasties could be run through a hard disk controller, like Supra's 10MB floppies. If not - I fear it may be hopeless.

99. PC-ditto

Newsgroup: comp.sys.atari.st
Date: 1987-11-10 23:45:20 UTC
From: L9D@PSUVMA.BITNET
Message-ID: <24821L9D@PSUVMA>
Source record: 256099

Does anyone know how to get PC-ditto to work with a monochrome monitor? I've read that a lot of other people are having problems with using monochrome, and I am wondering if a fix has been made yet?

Sincerely,
Matt Day

100. Re: midi to rs232?

Newsgroup: comp.sys.atari.st

In article <8711100411.AA12628@ucbvax.Berkeley.EDU>, AIPS@BRANDEIS.BITNET (Greg Lindahl [chimps@brandeis.bitnet]) writes:
>
> if the MIDI port is run by some sort of ACIA and is actually some fancy
> sort of rs232 port, could it possibly be reprogrammed a bit to be a
> "normal" rs232?
>

The MIDI port and the ikbd line are each provided by (Motorola) 6850 ACIAs. They are being clocked with a 500 kHz signal. The MIDI port uses the divide-by-16 mode of the 6850 to produce 31.25 kbaud, and the ikbd port uses divide-by-64 to produce 7812.5 baud.

The things that make your suggestion a tad messy:
1. The baud rate divisors provided by the 6850 have no finer granularity than /16 and /64. This precludes getting "standard" baud rates. (Unofficial hint: If you were willing to hack up your hardware, you could separate the MIDI 6850's TxClock and RxClock lines from the 500 kHz signal and provide them with your own baud rate clock. If you were willing to live with the restriction that the "MIDI" port would always have the same baud rate as the MFP serial port, you could probably get away with stealing the clock from the MFP's timer D output which is used as the MFP baud rate generator.)

2. There are no modem control lines available on the MIDI output connectors.

3. You will have to convert the MIDI current loop to RS-232C (or whatever your terminal expects).

101. Problems with new Midi ACIA Transmit Interrupts....

Newsgroup: comp.sys.atari.st
Date: 1987-11-11 00:54:54 UTC
From: lansd@utcsri.UUCP
Message-ID: <5642@utcsri.UUCP>
Source record: 256151

I have just recently finished writing new Midi Transmit and Receive interrupt drivers for the ST. Testing revealed a problem with the Transmit side. The test routine would fill up the transmit Midi buffer with 128 Midi notes (3 x 128 bytes), and would program the Midi ACIA to start interrupting if there were no data in the buffer previously to the new data being added. While the buffer was being filled, the ACIA would start interrupting and buffering the Transmit buffer out to the Midi port. This is what should happen. What actually happens is that the Midi ACIA Tx interrupts just stop coming in, even though there is data in the TX buffer. After spending about a week looking into this problem I realized that this random behaviour was due (I think) to other interrupts coming in - in particular the 200 hz system timer and mouse/keyboard interrupts.
It seems to me that these other interrupts, which are also handled by the MFP chip, are causing the MFP to drop the Midi ACIA's Tx interrupt request, so my software never sees it. How do I get around this problem? I solved it, in a crude way, by enabling the Tx interrupts EVERY time I write a byte into the TX buffer, but this slows the program down from 26ms (only enable them when 1st byte is written) to 156ms. The cause of the slow down is my program going into supervisor mode on each call to enable the ACIA Tx interrupts.
So either I fix this problem or resort to non-buffered Midi output. I am open to the wildest suggestions!

Sorry, but this is plain advertising. NO WAY I'll quote the real thing. It
should have been:

Jack TRAMIEL, COPYRIGHT 1987. REPRINTED BY PERMISSION

>workstations. A single transputer can deliver over ten times the power of
>an IBM PC AT. However, there's even greater strength in numbers. You can
>connect two, 10, 100 or even MORE transputers to create a relatively
>low-cost computer workstation with the power of a supercomputer.

False. The "standard" number of Transputers on the ABAQ system is 1 (ONE).
The maximum is 13.

>No firm delivery
>date is set, but late 1988 seems to be the most talked-about time frame.
>From a first-hand view, the crisp, vibrant graphics (such as four separate
>pictures running simultaneously) were drawing crushing crowds.

Not Really. I dropped in twice at the ATARI booth and the smallest crowds
were at the ABAQ setup. Both times I was able to talk with Tim King,
since NOBODY else was around.

Hello,

I recently received the COLOR version of the Double-Click Software Formatter, version 2.21. Is it possible for someone to send me the MONO versions of this? What other software is available from these guys? I used to have the Double-Click Corner Clock, but alas, it doesn't work with the new roms, so I got rid of it. Any other stuff I should be aware of?

In article <4059@watdragon.waterloo.edu> jafischer@tiger.waterloo.edu (Jonathan A. Fischer) writes:

20K worth of ANTIC ravings about how the Atari showings at Comdex made everybody in sight wet their pants, and were the greatest things in computing since Von Neumann.

Well, quite aside from the facts that A) ANTIC is probably the most self-serving of any of the computer magazines, regularly printing articles praising themselves and badmouthing everything that doesn't run the software they sell, and B) the vaprous nature of most of the products they were raving about, anyway (don't you remember the FIRST time the CD-ROM player was announced, folks? Like, the same time as the ST? Hmm?), there's still one thing: I don't know about the comp.sys.transputer folk, but I'm pretty sure that the comp.sys.amiga folk have only limited interest in 20K of Atari, and only Atari, news. Next time, how about editing the Newsgroups: line? I did.

Please, this isn't an effort to start another MCIB war. The ST is pretty nifty, and getting niftier all the time. So is the Amiga. So, for that matter, is IBM. So, any comments about my statements above should stay in comp.sys.atari, as will this response. I even promise not to bring the Amiga into this, o.k.?

ATARI MEANS BUSINESS
A REPORT FROM THE 1988 COMDEX
By Anita Malnig, START Editor

Las Vegas, November 2, 1987 --

Atari intends to give the likes of Sun Microsystems and Apollo Computers a run for the money with Abaq (the root word for abacus), the new transputer-based workstation that the company is showing here.
By using RISC (Reduced Instruction Set Computer) architecture, the workstation will operate at 10 MIPS (million instructions per second). The latest graphics hardware and the IMS T-800 -- the Inmos Company's 32-bit microprocessor -- combine to form affordable, powerful personal workstations. A single transputer can deliver over ten times the power of an IBM PC AT. However, there's even greater strength in numbers. You can connect two, 10, 100 or even MORE transputers to create a relatively low-cost computer workstation with the power of a supercomputer. (Talk is that the price will be in the $5000 range.) When attached to a transputer, the ST or Mega acts as the input/output device for the system. Transputers can be linked via a built-in high-speed serial port to form a multiprocessor array or a local area network.
Helios, the Unix-like operating system, was developed by the Perihelion Company in Great Britain, as was the transputer board itself. The Helios operating system encourages the use of many small programs which work together to create a final product.
Shiraz Shivji, Atari's vice president of research and development, expects that the transputer will be used primarily in engineering and science applications. Included with Abaq will be a very high resolution monitor, capable of four graphics modes: 1280 X 960 in 16 colors or monochrome; 1024 X 768 in 256 colors; 640 X 480 in 256 colors with two screens; and 512 X 480 in 16 million colors plus overlay. No firm delivery date is set, but late 1988 seems to be the most talked-about time frame.
From a first-hand view, the crisp, vibrant graphics (such as four separate pictures running simultaneously) were drawing crushing crowds.

CD-ROM FOR ATARI
The exciting CD-ROM player introduced at Comdex can read up to 540 megabytes of data or play music. It connects to Atari's ST and Mega computers through the DMA (direct memory access) channel, a communications port that transmits data at up to 10 million bits per second. At 540Mb, the player can store more data than 1,000 floppy disks or 200,000 printed pages.
Demonstrated at the show is an English and French visual dictionary from Facts on File. It is categorized by topics such as transportation and food: click on the transportation theme and choose from an array of topics such as ferrys, container ships, airport terminals and so on -- all items illustrated. Speech output identifies each image in French and English. Grolier's Encyclopedia also runs on this CD-ROM, as do audio CDs. Atari has a task force at work now developing more products for this player, which will be available at computer specialty dealers and retail outlets in February, 1988, at a suggested retail price of $599.
DO ATARI DESKTOP PUBLISHING
G.O. Graphics, in conjunction with Atari, will bring to market a sophisticated desktop publishing program called Deskset. This works as a front end to the CompuGraphics typesetting equipment, offering the use of 1,800 fonts. This is not just a desktop publishing program for four-page newsletters and the like: it could design entire publications such as Antic and START. It will output to such laser printers as the striking Atari laser printer, also being demonstrated with Deskset. (Look for the next Comdex installment for additional desktop publishing programs for the ST.) Deskset, which works only on a Mega, will work within the GEM environment and offers all the standard features of the most sophisticated desktop publishing programs -- features such as character compensation, kerning, columns, boxes, rules and the ability to merge text and graphics. Look for this product mid- to late 1988.
AND. . . ATARI PCS
The Atari PC1, introduced earlier this year, can be used as a local area network workstation or as a standalone personal computer. It runs at a top speed of 8 Mhz, with a software switch to set the clock speed to 4.77 when needed. The PC1 works with any CGA, MDA, EGA or multi-frequency monitor. Maximum color screen resolution is 640 X 350. The PC1 has a 64-color palette, with a maximum of 16 on the screen at a time. It is expected to retail at $800.
New to the Atari PC family is the PC2, a dual-speed XT compatible with five slots and hard-disk support. The PC4 is an 80286 microprocessor-based IBM PC/AT compatible machine. It has clock speeds of either 8 or 12 Mhz, VGA-compatible video, four AT-style expansion slots, up to one megabyte of system RAM and is ready for an 80287 numeric coprocessor.
Additionally, Atari is announcing "Moses PromiseLAN," a local area network that can connect up to 17 PCs using off-the-shelf telephone wire. They will also be developing Moses PromiseLAN adaptors for its Mega and ST computers. Thus, the Mega and Atari laser printer will be able to share data with PCs and Apple Macintoshes.
COMING NEXT UPDATE. . .
Watch for more third-party desktop publishing programs from Soft

Logik, Timeworks, Migraph. . . Multiuser, Multitasking programs with the Idris operating system. . . desktop video from Antic Software. . . products galore from MichTron, Spectrum Holobyte, Word Perfect, Abacus, ISD Marketing, B.E.S.T. and lots more.

ANTIC PUBLISHING INC., COPYRIGHT 1987 REPRINTED BY PERMISSION.

ST SOFTWARE SHINES AT COMDEX:
Multi-user, Multitasking on the Mega
By Anita Malnig, START Editor

Las Vegas, November 3 --

At the very crowded Atari press conference at the Desert Inn on Monday, November 1, Atari announced its entrance into the serious business market with an array of multi-user, multitasking products. The Atari booth itself was crowded with exciting products, interested spectators and busy software personnel. Here's a run-down of what we saw at the Atari booth.
MULTI-USER, MULTITASKING
Along with high-quality third-party developers, Atari will offer multiuser, multitasking and serious vertical applications on the Mega using a Unix-like operating system called Idris (developed by Whitesmiths Ltd.). The company, Computer Tools, was and still is instrumental in finding companies whose programs can be ported over from the Unix environment to Idris and porting those programs.
Jefferson Software is now releasing a version of their Modula-2 Development System for the Mega to run under Idris, offering a powerful language to complement the multi-user, multitasking operating system.
American Network's Cash Register Plus, the first of the multiuser, multitasking applications, is a point-of-sale program that lets you store and search up to 3,000 items. It supports a Star 8340 printer -- small to print out receipts -- and an actual cash drawer. It includes a customer and inventory database and backs up all information to disk. It can support four terminals with all cables attached to the Mega. This is expected to be on sale mid-January 1988 for about $700 for all the components.
During your inventory search, you may want to do some word processing. There are several word processors to choose from in this Idris environment. From the Tigera Corporation comes Word Era, a feature-rich, high-performance word processing package on single- and multiuser systems. It has a Wang-compatible interface and document conversion capabilities. Word Era has the features of leading word processing software and more, including a window environment, voice recognition and voice annotation. It can also set up menus in French, German, Italian and Spanish, and supports a four-user system. Available during the first quarter of 1988, the multiuser price begins at $895.
Another word processor is CrystalWriter Plus from Syntactics, providing a library of model documents for frequently used formats such as letters, memos and reports. An organization can define its own "style

sheet" for documents. The program has "plain English" commands and can be useful for writers, editors, secretaries, managers and engineers.
Also ported from the Unix world is Lex, a combined word processor and database, from Trajectory Software. Its indexed file structure lets you retrieve the 10,000th record as quickly as the first. You can design your own forms and screen layouts, create short and more extensive glossary items, and do list processing and mail merges. It also comes with a built-in calculator which you can use concurrently as you write or edit.
Also available is Lexet, which lets you interface the word processor and database with laser printers.
Atari Corp. is handling the networking capabilities through an agreement with Network Research Corp. With FUSION, Network Software will give the Atari Mega a complete set of TCP/IP protocols and allocations which have been tested for compliance with DDN/DARPA Internet Protocol specifications.
MORE DESKTOP PUBLISHING
From Timeworks comes the Timeworks Desktop Publisher ST. Retailing for $129.95 this GEM-based program will offer WYSIWYG display, over 1,200 possible type-style combinations, ability to import graphics, and laser printer compatibility. Desktop Publisher ST will be available in the first quarter of 1988.
Soft Logik Corp. announced a new version of its desktop publishing program, Publishing Partner Professional. New features include automatic textflow around graphic images, automatic hyphenation and kerning, the ability to import documents from other word processors such as WordPerfect, First Word and Word Writer, more fonts and font manipulation. It will retail for $149.95.
From ISD Marketing comes Calamus, a page-layout and typesetting application. It allows outline fonts and vector graphics that until now could only be processed by expensive Postscript laser printers. Calamus uses these features on both the printer and screen. The screen output can be enlarged up to laser printer resolution. The program offers a spelling checker and hyphenated dictionary, object-oriented graphics, chart forms, and font editors using Bezier curves for designing or changing fonts.
Calamus for the Mega will be available in December 1987 for $349.95.
MichTron offers GFA Publisher, a GEM-controlled program with full-featured text editor, automatic text flow and paging, expandable font library and an integrated driver for PostScript.
From Migraph comes the supercharged Easy Draw. And Supercharger, a companion product to Easy Draw, makes it easy to load graphics from popular paint programs. While not a desktop publishing program, these two combined products let you create newsletters, reports, brochures, etc. You can work with ASCII files, have justified and non-justified text, use onscreen grids and rulers and output to the Atari laser printer.
LET'S EMULATE
Turn your ST into a Mac with The Magic Sac Professional from Data Pacific. The Professional consists of three products: The Magic Sac Plus, the Translator One and the Magic Epson Printer Driver. The Translator One allows the existing Atari disk drive to read and write Apple Macintosh disks and convert data between Mac, ST and IBM PC diskette

formats. The Professional is shipping this month with a suggested retail price of $449.95. Typical Mac programs you can run are Macpaint, Macdraw, Excel and Pagemaker.

PC-Ditto is a software-only utility which taps the power of your Atari ST to imitate an IBM PC XT. Programs you can run include Lotus 1-2-3, Enable, Sidekick, Framework and Symphony.

WORD PROCESSING -- ALIVE AND WELL

WordPerfect for the ST is out and is called by some the Cadillac of word processors. In addition to a built-in thesaurus and spell-checker, the program has math functions anc can create indexes,and tables of contents. There are also macros, merge functions and onscreen columns. The product is shipping now for about $395 list.

From Microsoft comes the long-awaited Write, marketed by Atari Corp. It handles complex business reports as well as memos and letters. It has all the standard text generation, editing and formatting features such as cut-and-paste, creating footnotes, automatic pagination, different font styles and sizes, and it works in conjunction with the Atari Laser printer.

MORE CAD PROGRAMS

Drafix, from Foresight Resources, is now on the market and drawing critical acclaim. It's identical to the 1.00 IBM PC version, supports pen plotters, and runs on color and monochrome Atari monitors.

Coming soon from Migraph is M/CADD, a professional engineering graphics design system for the Atari Mega. M/CADD outputs directly to HPGL-compatible plotters and saves in GEM format for output on 9- and 24-pin dot-matrix printers. M/CADD files can be loaded into Migraph's Easy Draw, and you can add more text and either bit-mapped or object-oriented graphics. Suggested price is $499. M/CADD should ship the end of November.

With MichTron's Master CAD, you can produce object in 2-D and 3-D using its exclusive concepts of Projection Planes. It uses pull-down menus, dialog boxes, mouse and very few keyboard commands. Expect to see this in early 1988.

DESKTOP VIDEO

From Antic Software in conjunection with Sony comes a desktop video package. Sony's low-cost 8mm video hardware and Antic's video sequencer software create professional-quality 3-D computer-graphics videotapes of up to two hours. The Antic software controls nine functions of the Sony VCR, then adds its own special visual effects such as fades and auto assemble/editing. The 8mm video sequencing software (including custom parallel cables) will be available in January 1988 from Antic Software. The Sony video equipment is available from Sony.

MORE GRAPHIC FUN

From Neriki Computer Graphics PTY Ltd. in Australia comes the ZImagemaster, software with a hardware box to attach to your ST. Hooking up the Polaroid Palette can output DEGAS pictures as Polaroid pictures, And you can hook up a 35mm camera to the Palette. The package yields overhead transparencies and printouts. It will retail for $400.

Antic Software is also showing Spectrum 512, its 512-color paint program, which expands the ST's normally limited palette of 16 colors to 512. Spectrum 512 can load and enhance pictures from existing ST software

as well as from Amiga picture files. Available now for $69.95.
Animation comes from Antic Software as well with Cyber Paint, also $69.95. It emulates the functions of a $100,000 Quantel Paintbox -- but for computer graphics instead of live video. Cyber Paint is a member of the Cyber family of desktop video products. Its many features include smooth raster tweening along any 3-D path, professional optic effects with planar rotations through 3-D space, and moviola-style cut-and-paste.

MORE BUSINESS BITS

The Informer from Regent Software is a multi-table database with presentation graphics. Easy-to-use point and click functions let you create and manipulate up to four databases at once. You can import graphics from DEGAS and NEOchrome... From SBT comes the Database Accounting Library, menu-driven with options to confirm, change or cancel entries... Hi-Tech Advisors announces Super Sales Pro, a full-featured point-of-sale inventory control software system for the ST. It will accomodate medium- to larger-sized wholesale, retail or mail order businesses. The company will provide free technical support... From Progressive Peripherals comes Superbase Personal, a relational database, and the Logistik time/project management system... B.E.S.T Inc. offers B.E.S.T. Business Management, an integrated accounting system offering general ledger. Available now, suggested retail price is $395... ISD Marketing, which brings you the well-known VIP, now has the MasterPlan financial spreadsheet featuring the GEM environment with pull-down menus, icons, scroll bars and column grabbers. It offers graphics features as well. Also from ISD is an update to STAccounts, the integrated accounting package... From Royal Software comes additional low-cost business programs such as Help Calc, templates for their E-A Calc and VIP. Coming soon will be Inventory Master for $99.95.

MIDI

Hybrid Arts was showing ADAP and ADAP 2, the digital editing system. ADAP 2 works directly with a hard disk. Also just released is Easy Score, Hybrid Arts' new scoring program.

NEW HARD DRIVE

In mid-December ICD will ship its new 100 megabyte hard disk for $1,699.

Source record: 256157

I don't claim to be an expert on the Sac, though I am pretty familiar with Macs in general. I imagine that Freeterm 2.0 isn't working because it has been upgraded to work better with the Mac Plus's 128K ROMs. If routines from the new ROMs are being called, it just ain't going to work with the Sacs older 64K ROMs. Best advice would be to continue to use Freeterm 1.8. Failing that, buy a Mac!

[ text of example deleted ]

There is a much simpler way to find the length of a file. You simply
do an Fseek to the end of the file. This means of getting the length
of a file is also usable with Unix and MSDOS (if not always necessary).
(I'm doing this from memory):

void
Example (filename)
char *filename;
{
int f, length;
f = Fopen(name,0);
if (f > 0)
{
length = Fseek(f,0,2); /* seek to end of file */
Fseek(f,0,0); /* seek back to beginning of file */
/* we now know the size of the file */
ProcessFile(f,length); /* for instance */
Fclose(f);
}
}

109. Gulam notes (alpha test v0.01.00) -old

Newsgroup: comp.sys.atari.st
Date: 1987-11-11 17:29:31 UTC
From: csrobe@nh.UUCP
Message-ID: <8711111729.AA06652@nh.wmcs.uucp>
Source record: 256159

A couple of comments and questions about Gulam.

1) There is a command called 'sx' that is documented by referring you to
a command called 'rx', but rx doesn't exist. Can someone tell me what these
commands do?

2) From ue (emacs) when you type a ^K is 'temporarily' pops you into Gulam
and your editing buffers are not FREED. The manual says to try this but
doesn't say how to return to emacs. So far I only tried running emacs
then ^x^b to the buffer i was editing. Is there a more direct way to return
to your editing after doing a ^z (oops that was supposed to be a ^z not a
^k up there, sorry).

3) Finally, in ue, if you do several delete-backward-words (M-BS) then do
a yank (^Y) your deletes will be restored in reverse order. SO the line,
Delete this line backwards.
becomes
backwards. line this Delete
when you restore.

^^*^*^*^*

How does one get to atari-sources to find out what is there and to ultimately
upload or download (correct terminology?) something to/from them or is it
only a part of netnews.

thanks,
-chip

111. Re: high density 3.5" disks

Newsgroup: comp.sys.atari.st
Date: 1987-11-11 21:04:48 UTC
From: cmcmanis%pepper@Sun.COM
Message-ID: <33643@sun.uucp>
Source record: 256161

The scoop on the high density drives is that they use a data clock that is twice as fast as the low density drives. On Amiga/Atari/PC-XT type 5.25 and 3.5 inch disks this clock runs at 250Khz, on the AT and PS/2 this clock runs at 500Khz. Exactly double the speed, means you can fit twice as many sectors on a track and double your storage (720K -> 1440K). The standard Western Digital minifloppy only controllers will not read or write this format. The WD1793 and family of dual 8"/5.25" controllers will given they are supplied with the proper clock. Also, when you double the bit rate you cram more bits in the same space so your drive mechanism has to be able to resolve a higher number of flux changes/inch (fci) and the diskette has to be capable of retaining those flux changes faithfully. So all you need are a new controller, drive, and diskettes and you're all set. No I don't if anyone is planning on offering them for the above mentioned computers (except the AT and PS/2 of course).

112. GULAM PROBLEMS

Newsgroup: comp.sys.atari.st
Date: 1987-11-11 21:17:25 UTC
From: jdn@homxc.UUCP
Message-ID: <2104@homxc.UUCP>
Source record: 256162

Has anyone succesfully uudecoded the recent GULAM postings?
I found that all my byte counts were initially 2 bytes larger
than those posted, pesumably due to two extra blank lines at the
end of each file. I deleted these extraneous blank lines, and all
the byte counts matched. But when I try to to uudecode them, I
get the message "Short file", and indeed, my gulam.arc is only
22284 bytes. [My files are correctly named gulam.uaa, etc.]

Any suggestions?

And I guess that is the real problem here... I talked with
one of the local dealers, and they plan to fix MEGAS just like they
fix 520/1040's ===> "Oh, so your ST is sick? Bring it in and we'll charge
you X dollars, and you can take it with you... Never mind that the
serial number is different." That's right... most dealers here fix STs
by simply replacing them with a new one - very "prompt service", and they
don't need (or intend) to use your $4000 worth of parts!

And besides, who do you think really pays for those part
anyway ;-(. I think that this whole thing boils down to Atari wanting
the "image" (or should that be "look and feel" ;-)) of an IBM
dealer - high prices, fast service, and very few customers who can
afford all of that glitter.

123. Re: Atari/Perihelion Transputer Machine Spec

Newsgroup: comp.sys.atari.st
Date: 1987-11-12 15:43:58 UTC
From: trb@stag.UUCP
Message-ID: <254@stag.UUCP>
Source record: 256173

If I hadn't seen the exact same CD-ROM being displayed in several non-Atari booths (i.e. for the IBM PC) I would be skeptical about whether it would ever make it out either. My only concern is that it sells for $999 on the PC. It really was the same unit, too. Only the case color was different. As for the Transputer, I was really impressed with the progress they (Perihelion) had made. We have some Transputer's at work (boards for the AT) that are pretty loosely integrated (kind of like an exerciser kit), and the ABAQ definitely had progressed far beyond that. I ALMOST ordered the $100 set of preliminary manuals to become a developer (I can think of lots of CAD tools that would be nice to port...Place and Route Previewers, GDSII compatible layout editors, etc...but I couldn't get any good feel for what the final costs would be to get a full set of developer hardware.) If any of people actually do order the kit, let us on the net know how it looks.

-Todd Burkey
trb@stag.UUCP <--faster path
or tburkey@eta.swde.com <--shaky sun<->apollo (I want Aegis 10!)

P.S. I just got through porting HDSCAN to my Symmetrics, the Apollo, and the Sun. It runs very nicely on any standard 4.2 system (kind of slow on the Apollo...usable on a 3000). After I clean up a few things and add some more sort options (gid/uid/other times?) I will have to decide if I am going to make it public domain at the source level or what...BTW, it takes a lot longer to traverse trees using Unix opendir/readdir/stat calls than it does on the ST (3 secs/30 megs on the ST vs 40 secs/24 megs on the SUN 3/60 with Eagle drives...>2 minutes for the same on the Apollo).

125. file i/o functions

Newsgroup: comp.sys.atari.st
Date: 1987-11-12 17:29:35 UTC
From: daemon@stag.UUCP
Message-ID: <255@stag.UUCP>
Source record: 256175

Hopefully the following will help clear up the confusion about file i/o functions...

Fread() is one of the macros which calls Gemdos through trap #1. This is an exerpt from the <osbind.h> file containing there macros:

```
#define Fcreate(fn,mode) gemdos(0x3C,fn,mode)
#define Fopen(fn,mode) gemdos(0x3D,fn,mode)
#define Fclose(h) gemdos(0x3E,h)
#define Fread(h,cnt,buf) gemdos(0x3F,h,cnt,buf)
#define Fwrite(h,cnt,buf) gemdos(0x40,h,cnt,buf)
#define Fdelete(fn) gemdos(0x41,fn)
#define Fseek(where,h,how) gemdos(0x42,where,h,how)
```

These functions work much like the standard low-level i/o calls. They use a small integer (returned by Fcreate/Fopen) called a file handle to refer to the file (the 'h' parameter in other calls). As was mentioned, the parameter order is different from the standard low-level i/o calls, and the 'cnt' parameters are long values rather than the int than is normally used. The following are macros which define some of the low-level i/o calls in terms of their Gemdos equivalents.

```
#define open(filename,iomode) ((int)gemdos(0x3D,filename,iomode))
#define close(h) ((int)gemdos(0x3E,h))
#define read(h,data,len) ((int)gemdos(0x3F,h,((long)(len)),data))
#define write(h,data,len) ((int)gemdos(0x40,h,((long)(len)),data))
#define lread(h,data,len) (gemdos(0x3F,h,len,data))
#define lwrite(h,data,len) (gemdos(0x40,h,len,data))
#define unlink(filename) ((int)gemdos(0x41,filename))
#define lseek(h,where,how) gemdos(0x42,where,h,how)
#define tell(h) gemdos(0x42,0L,h,1)
```

The creat() call is notably missing from the above due to a bug in the underlying gemdos 0x3C function which sometimes creates a new file with the same name as an existing file instead of overwriting the old file. Thus creat() is implemented as a function something like this:

```
int creat(filename, pmode)
register char *filename;
register int pmode;
{
register int rv;

rv = Fdelete(filename);
if((rv == 0) || (rv == -33)) /* SUCCESS or FILE-NOT-FOUND */
rv = Fcreate(filename, pmode);
```

```
return(rv);
}
```

Now we come to the fread()/fwrite() functions. These are standard i/o functions which deal with STREAMS rather than simply with FILE HANDLES. Unlike the above, these functions provided buffering and translation of newlines, if desired. They are used with fopen()/fclose() functions. The fopen() function returns a pointer to a FILE structure, which contains information about the stream that was opened. The fopen() function also handles the open()/creat() distinction, creat()ing a file if is doesn't already exists, etc. As was said before, this kind of processing does make the i/o a little slower, but also easier to use. The fputc()/fgetc() functions are normally used with streams (getchar()/putchar() are written in terms of fputc()/fgetc()) to do i/o a character at a time, while internally buffering the calls to prevent a system call for every character processed (which would be slow). The fread()/fwrite() functions do block i/o on streams, and are buffered just like single characters.

In summary, you should avoid using Gemdos calls directly, since it is not portable and it doesn't gain you any speed. Use the low-level i/o if you're really concerned about speed and use the stream i/o functions if you're doing mostly character or string i/o and/or want the buffering done efficiently for you.

The preceeding examples were taken from the dLibs public domain standard library for Alcyon C. This implmentation is far freer of bugs and much more efficient in general than the Alcyon/DRI libraries. dLibs also contains many Un*x standard functions which were not included in Alcyon/DRI. You can get a copy of dLibs with complete source code and documentation by sending $3 to:

126. GULAM, Transputers, comp.*.atari.st

Newsgroup: comp.sys.atari.st
Date: 1987-11-12 22:19:16 UTC
From: lean@sbcs
Message-ID: <816@sbcs.sunysb.edu>
Source record: 256176

I completely agree with Michael Ferran. A 20K posting of 'news' from Comdex, which is essentially a 20K posting of praise for the ST does NOT belong in comp.sys.amiga. Come on fellows. It doesn't take too much common sense to know that such posting is not welcomed in comp.sys.amiga nor of any particular use. I'm sure we ST people wouldn't like to see a posting of PRODUCTS for the Amiga on our group either. And to see that article cross-posted so many times really makes me think there are id__ts in this world.

Regarding comp.binaries|sources.atari.st, I agree that there has been less articles posted there than what we might like to see. However, we have to realize that Jim Turner is not paid for doing this, and he has a full-time job to take care of at the same time. I like to suggest the following:

i) if you have a relatively small program (<= 15K) and have tested it adequately, then post it straight to comp.sys.atari.st

ii) if you have a BIGGIE (> 50K) to post, test it thoroughly and mail it to JIM TURNER.

iii) if you have a program that falls between the other 2 ranges, then either test it very thoroughly (and I mean very thoroughly - like thorough enough that even Microsoft will buy it) and post it straight to comp.sys.atari.st (assuming that it's something useful) or test it adequately and mail it to Jim.

I've found a 'bug' in the recently posted GULAM. If you cat a file and then abort it halfway with ^C, you'll be thrown back to the desktop. But the new GULAM is really great! Thanks Prabhaker and Jwahar !

In the referenced article, jdn@homxc.UUCP (J.NAGY) wrote:
>
>Has anyone succesfully uudecoded the recent GULAM postings?
Yup. I saved all three parts to one file. Edited it with vi
and removed the header of the first part. Searched for the
line that started with include
and deleted it down to the table line of the second part and
make it seamless, i.e. all lines starting with X
and did the same connecting the second part to the third part.
so when I finished the whole file looked the same (after the
first table header) with each line starting with the same character.
Ran uudecode on it.

Ditto for the doc file. arc said they were ok, so I downloaded them
to the ST and de-arced them there. They were fine and I've enjoyed
using the new Gulam.

Hope that helps.

128. Bugs in MWC? Also, Re: Disk I/O

Newsgroup: comp.sys.atari.st
Date: 1987-11-13 00:15:04 UTC
From: Gribnif@UMass.BITNET
Message-ID: <871112190721354.AKXR@Mars.UCC.UMass.EDU>
Source record: 256178

I have recently discovered a few peculiarities (read: what I think are
bugs) in MWC version 2.0.1:

1) Declaration of integers: you would think that
int i = -32768
would work, since this is a valid number in ones-complement
arithmetic, however this invariably results in the compiler message
'integer "i" promoted to long'. Also, changing the "int" to "unsigned
int" yields the same result whenever you are trying to assign
any number >=32768 (without sign, of course).

2) Try this:

```
main()
{
unsigned long int ii;
int a, b;

ii = 0L;
a = 4097;
b = 8;
ii += a * b;
printf( "%D\n", ii );
}
```

The result I am lead to expect from all my reading is that the number
4097*8=32776 would be stored in "ii", however the compiler fails to
convert the result of "a*b" to unsigned long before adding it to
"ii", so what gets stored is -32760, the ones complement of "a*b".
The only way you can get this to work correctly is by specifying the
type:
ii += (unsigned)(long)(a * b);
Notice also that I did not use "(unsigned long)", as this does not
work either.

Ok, is it just me, or are these truly bugs? I'd kinda like to know
before I send that small incendiary device off to Chicago...
Also, on the subject of the "f" I/O functions vs. the "F" ones, I
recently used fread to load a large (c300K) file directly into memory from my
hard disk. What I found was that not only did fread take about 4 times as long
to read the file, but it also started overwriting previously loaded data.
I tried loading it in different size blocks (starting at 16K, all the way down
to 128 bytes, which is smaller than the buffer size) with the same results.
Actually, in this case it made much more sense to Fread anyway, since it takes
a long as an argument, as opposed to an unsigned int for fread.
Sorry about the length of this, folx, I'm just making up for all those

times I wanted to put in my two bits and never got around to it...

Dan Wilga

>

I wondered about this also, for some time. Then I decided to
test it out. A friend and I each wrote the same program, but
I used the capital F calls, and he the lower case f calls. I
even put more bells and whistles into my program, and the speed
is significantly higher, even accounting for the fact that I
have to do my own buffering and managing.

8K to 16K are the best speeds, to get the most out of your
floppies. I haven't done any tests to see how much difference
buffer size makes on a hard disk (my Supra died!).

I read the recent postings about ABOFT F77, and it seems to be what i'm
looking for.
Does anybody know where I can buy ABSOFT FORTRAN 77 here in Germany ?
The only advertising i can find in magazines is for prospero f77.

Thanks, Werner

This is a VERY slow way to do it. Especially on LARGE files where
the seek is worse than the open.

Why not just use Fsfirst and read the file size out of the DTA?
This works on both Gemdos and MSdos.

True he didn't get into the promised land, but he did get to see it.
It's more like getting the product announcement sheet, seeing a demo,
but never getting any hands-on experience.

"It'll be here next week."
"But I won't be."
"Sorry fellow."

139. No More ROM woes!

Newsgroup: comp.sys.atari.st
Date: 1987-11-13 16:46:00 UTC
From: ftw@datacube.UUCP
Message-ID: <105100030@datacube>
Source record: 256189

I received some more new ROMs from Atari yesterday. Happy to report that they appear to work just fine!

The first things I noticed were a *substantial* decrease in time required to boot, because the time it takes the machine to clear out memory is now much less. Hmm, makes that extra meg seem much more tempting ;-)
Overall disk performance seems to have a good boost. I ran TINYPICS from my Supra disk, and it was noticeably faster at switching pictures. The only copy protected thing I currently own is Chessmaster 2000, and I haven't given that a whirl as yet.

Thanks to Allan Pratt and Neil Harris for their comments and help, and to the Net.people who confirmed my guesses about the ROM placement.

141. Scanners anyone?

Newsgroup: comp.sys.atari.st
Date: 1987-11-13 18:16:53 UTC
From: roydant@hpgrla.HP.COM
Message-ID: <4110003@hpgrla.HP.COM>
Source record: 256191

This is a basenote to find out what kind of response there would be from atari users about buying a scanner for desktop publishing.

To digress a moment a scanner is a device which will digitize a document (book,magazine,etc..) and load onto a hard disc as an image. This image then can be treated as a picture in desktop publishing or run through an optical character recognizer (OCR) which would convert image to ASCII representation and thus used by word processors.

My need is to discover building the necessary hardware and software drivers myself for the ScanJet that HP makes. In other words is it worth my time if only three people want it or are there thousands of you out there.

This project in no way is connected to my work and will be doing it alone so keep in mind the resource limitation. Of course should you desire to let Atari now about your desires or HP dealers you never know where this could go.

Thanks for reading,
Roydan Tomlinson

142. OS-9 , gulam

Two questions:
1. Recently I read in the atari digest that a new version of the gulam shell has been posted. Does anybody know whether I can get it from a LISTSERV?

2. I'm thinking of buying OS-9. Could OS-9 users (on Atari ST) report their experiences? Has anyone used both, OS-9 and RTOS-UH? Which is better?
Thank you
Michael Eibl

143. RF Modulator for the 1040?

Newsgroup: comp.sys.atari.st
Date: 1987-11-13 18:50:00 UTC
From: Brantly.henr@XEROX.COM
Message-ID: <871113-105048-2184@Xerox>
Source record: 256193

At one time (quite a while ago) there was quite a bit of discussion about "Someday SOMEBODY is going to come up with the means to drive a TV from a 1040ST".

I like my monochrome system, but I'm missing out on a lot of pgms that only support color. I REALLY hate the idea of spending the $300+for a color monitor.

Soooo, did the idea of a RF Modulator for the 1040 ever take off? Did I miss something or did the idea get thrown out? I know it's not a real "hot button" for you guys/gals out there with color systems....

Thanks,

Dennis

Subject: IKBD commands/reads

Is there an easy way to get the clock time from the keyboard?
It would be nice to use a clock with one second resolution instead
of GEMDOS's 2 second clock.

I would also like to be able to set this clock.

I know that there is an XBIOS call to send bytes to the keyboard,
but how do we receive them? (I have no idea where the keyboard
packets are sent or what format they have or ... you get the picture. :)

Just in case anyone cares, I'm using Personal Pascal.

>read that a lot of other people are having problems with using monochrome,
>and I am wondering if a fix has been made yet?

The current version works only with a color monitor as the packaging states.
There is a zap to 'turn on' the screen in a monochrome system but it is
NOT a fix and the resulting screen is barely readable.

Version 3.0 is at the duplicating house. It features mono support, Microsoft
mouse emulation, TOS time/date transfer, bug fixes, etc.

> The maximum is 13.

Internally.

The ABAQ includes 3 "links", which are 10-megabit-per-second serial
interfaces for talking to off-board transputers.

Jack Lang, in his talk at the Atari press conference at Comdex, supposed a
setup where workers each had their own transputer system on their desks,
with all of them linked together and linked to a separate box containing
many transputers. As an application's need for processing power increased,
it could pull more transputers in. An intriguing concept -- throw the
computer into high gear.

]At one time (quite a while ago) there was quite a bit of discussion
]about "Someday SOMEBODY is going to come up with the means to drive a TV
]from a 1040ST".

And so do I!
I know this can be done; there was a description and a sample of a circuit
that would do this in Bruce "sublogic" Artwick's book on computer graphics.
I believe it was titled _Microcomputer_Graphics_and_Animation_.

I also keep hearing about some company called JNL Technologies that
apparantly made one of these dodads.

This device would be a boon to all the ST owners without RF output (520ST[f]s
have RF output as you all know) who want to videotape some screens.

149. uw & different fonts for microemacs

Newsgroup: comp.sys.atari.st
Date: 1987-11-14 01:08:58 UTC
From: moe@athena.mit.edu
Message-ID: <1807@bloom-beacon.MIT.EDU>
Source record: 256199

I have 2 questions for neters concerning uw and emacs:

1. What exactly is uw ? Is it a window manager ? Is it compatible with X window system version 11 ? If it is, can it run over dial-up phone line or does it need to have a high speed network to work ?

2. Is it possible to load a 6x10 font to be used with mg(microgNUemacs) or me(microemacs) (I have a ME version 3.9 that has 40 lines display on monochrome with font width of 8 pixels, and also a MG version 1a that can display 50 lines if I run "hi50.tos" first but the width of the character is 8 pixels so it is kinda hard to read). Better yet can proprotional fonts be used instead of monospaced fonts. I realised that it is hard to used get a font with width of 6 to work with TOS (since 640 divided in to 6 is 106. something) but is it impossible?

Thanks in advance for any helpful information,
Hai

PS: I guess that was more than 2 questions...

From: decvax!minow@ucbvax.Berkeley.EDU (Martin Minow)
Subject: Re: External Keyboard (Dec LK201)
To: info-atari16@score.stanford.edu

My apologies for posting this without summarizing the original article.
However, as it refers to a safety issue, I feel the completeness is
appropriate. In the attached article, Farrell Woods points out that the
(Dec) LK201 keyboard warns the user against using an unapproved cable.
Because he refers to "really cheap cables", the reader may incorrectly
decide that expensive cables would work. While the LK201 cable looks
like a standard modular phone cable, it is build using significantly
heavier gauge wire -- as it carries the power needed by the keyboard.
Ordinary LK201 usage exceeds the rated capacity of standard modular phone
cables. You can order replacement cables from Dec Direct.

Martin Minow
decvax!minow
The above does not represent the position of Digital Equipment Corporation.

In article <105100029@datacube> ftw@datacube.UUCP writes:

To: info-atari16@score.stanford.edu
Subject: Gulam notes (alpha test v0.01.00) -old

A couple of comments and questions about Gulam.

1) There is a command called 'sx' that is documented by referring you to
a command called 'rx', but rx doesn't exist. Can someone tell me what these
commands do?

2) From ue (emacs) when you type a ~K is 'temporarily' pops you into Gulam
and your editing buffers are not FREED. The manual says to try this but
doesn't say how to return to emacs. So far I only tried running emacs
then ~x~b to the buffer i was editing. Is there a more direct way to return
to your editing after doing a ~z (oops that was supposed to be a ~z not a
~k up there, sorry).

3) Finally, in ue, if you do several delete-backward-words (M-BS) then do
a yank (~Y) your deletes will be restored in reverse order. SO the line,
Delete this line backwards.
becomes
backwards. line this Delete
when you restore.

~~*~*~*~*

How does one get to atari-sources to find out what is there and to ultimately
upload or download (correct terminology?) something to/from them or is it

only a part of netnews.

thanks,
-chip

Subject: re: Uniterm 2.0 / BIGformat.acc
To: info-atari16@score.stanford.edu

As was mentioned in a previous posting, Uniterm 2.0 is NOT out yet,
but will be very very soon. So you panicky guys did not missed any
postings.

Uniterm 2.0BETA version can be obtained from the server at Houston,
although I'm not sure if it's supposed to be there. Since the official
version 2.0 will be out very soon now, I think we should just wait.

As i mentioned in my posting of BIGformat.acc, it worked fine for me
on my monochrome although the read/writes are slower. I've used it
for about 2 months now, mostly for storing documents and misc stuff.
If it caused trouble for anyone, I hereby apologize. I posted it
because I got quite a number of request from fellow-netters.

Anyone out there using publishing partner together with Beckemeyers'
C-SHell or GULAM? Please email me. Thanks

From: pepper!cmcmanis@sun.com (Chuck McManis)
Subject: Re: high density 3.5" disks
To: info-atari16@score.stanford.edu

The scoop on the high density drives is that they use a data clock that is twice as fast as the low density drives. On Amiga/Atari/PC-XT type 5.25 and 3.5 inch disks this clock runs at 250Khz, on the AT and PS/2 this clock runs at 500Khz. Exactly double the speed, means you can fit twice as many sectors on a track and double your storage (720K -> 1440K). The standard Western Digital minifloppy only controllers will not read or write this format. The WD1793 and family of dual 8"/5.25" controllers will given they are supplied with the proper clock. Also, when you double the bit rate you cram more bits in the same space so your drive mechanism has to be able to resolve a higher number of flux changes/inch (fci) and the diskette has to be capable of retaining those flux changes faithfully. So all you need are a new controller, drive, and diskettes and you're all set. No I don't if anyone is planning on offering them for the above mentioned computers (except the AT and PS/2 of course).

From: ihnp4!homxb!homxc!jdn@ucbvax.Berkeley.EDU (J.NAGY)
Subject: GULAM PROBLEMS
To: info-atari16@score.stanford.edu

Has anyone succesfully uudecoded the recent GULAM postings?
I found that all my byte counts were initially 2 bytes larger
than those posted, pesumably due to two extra blank lines at the
end of each file. I deleted these extraneous blank lines, and all
the byte counts matched. But when I try to to uudecode them, I
get the message "Short file", and indeed, my gulam.arc is only
22284 bytes. [My files are correctly named gulam.uaa, etc.]

Any suggestions?

Isn't MagicSac that thing that needs Apple ROMs to operate?

Where'd you get your ROMs?

Hello,

I recently received the COLOR version of the Double-Click Software
Formatter, version 2.21. Is it possible for someone to send me the MONO
versions of this? What other software is available from these guys?
I used to have the Double-Click Corner Clock, but alas, it doesn't work
with the new roms, so I got rid of it. Any other stuff I should be aware
of?

I don't claim to be an expert on the Sac, though I am pretty familiar
with Macs in general. I imagine that Freeterm 2.0 isn't working because
it has been upgraded to work better with the Mac Plus's 128K ROMs. If
routines from the new ROMs are being called, it just ain't going to work
with the Sacs older 64K ROMs. Best advice would be to continue to use
Freeterm 1.8. Failing that, buy a Mac!

> 1. UUDECODE - I take it from my perusals of the network that UUDECODE is way
> different from ARC - but how different?

ARC is several things at once... It can combine several files into
one file, gives you a check sum, and, unless you force otherwise, will
compress them according one or another data compression method.

UUENCODE, is a program that takes as input any file (such as a ".TOS"
file or an ARC file, for instance) and produces another that contains
only printable characters. UUDECODE is the inverse of UUENCODE.

If I understand correctly, the use of XMODEM requires use of all 256 8-bit
characters to do a transfer. This may be OK if you are calling from your
computer to another via one direct phone link, as well as
in some other circumstances.
However, some networks, for their own purposes,
respond to control characters, and for that reason, folks have
settled on schemes that move only printable characters. (Hence UUen-
and UUde-code.) Even this has caused some problems because *some*
machines that come in BLUE boxes and use EBCDIC codes are a bit out of
sync with these that use ASCII codes.

> 2. UNITERM - I've seen this mentioned a few times.
> From what I see it seems to be pretty good. Does it have KERMIT?

Yes it is great, and yes, it has KERMIT.

All our mainframes here run KERMIT, even those that come in BLUE boxes.

> sort of rs232 port, could it possibly be reprogrammed a bit to be a
> "normal" rs232?
>

The MIDI port and the ikbd line are each provided by (Motorola) 6850 ACIAs.
They are being clocked with a 500 kHz signal. The MIDI port uses the
divide-by-16 mode of the 6850 to produce 31.25 kbaud, and the ikbd port uses
divide-by-64 to produce 7812.5 baud.

The things that make your suggestion a tad messy:
1. The baud rate divisors provided by the 6850 have no finer granularity
than /16 and /64. This precludes getting "standard" baud rates.
(Unofficial hint: If you were willing to hack up your hardware, you could
separate the MIDI 6850's TxClock and RxClock lines from the 500 kHz signal
and provide them with your own baud rate clock. If you were willing to
live with the restriction that the "MIDI" port would always have the same
baud rate as the MFP serial port, you could probably get away with stealing
the clock from the MFP's timer D output which is used as the MFP baud rate
generator.)

2. There are no modem control lines available on the MIDI output connectors.

3. You will have to convert the MIDI current loop to RS-232C (or whatever
your terminal expects).

Subject: Problems with new Midi ACIA Transmit Interrupts....
To: info-atari16@score.stanford.edu

I have just recently finished writing new Midi Transmit and Receive
interrupt drivers for the ST. Testing revealed a problem with the Transmit
side. The test routine would fill up the transmit Midi buffer with 128 Midi
notes (3 x 128 bytes), and would program the Midi ACIA to start interrupting
if there were no data in the buffer previously to the new data being added.
While the buffer was being filled, the ACIA would start interrupting
and buffering the Transmit buffer out to the Midi port. This is what should
happen. What actually happens is that the Midi ACIA Tx interrupts just stop
coming in, even though there is data in the TX buffer. After spending about a
week looking into this problem I realized that this random behaviour was due
(I think) to other interrupts coming in - in particular the 200 hz system
timer and mouse/keyboard interrupts.
It seems to me that these other interrupts, which are also handled by
the MFP chip, are causing the MFP to drop the Midi ACIA's Tx interrupt request,
so my software never sees it. How do I get around this problem? I solved it, in
a crude way, by enabling the Tx interrupts EVERY time I write a byte into the
TX buffer, but this slows the program down from 26ms (only enable them when 1st
byte is written) to 156ms. The cause of the slow down is my program going into
supervisor mode on each call to enable the ACIA Tx interrupts.
So either I fix this problem or resort to non-buffered Midi output. I
am open to the wildest suggestions!

>use these disks?

These diskettes write 80 tracks x 18 sectors/track. They require a special drive mechanism whose write bias is adjusted by a special pin on the cardedge. Similar to the way AT clones enable the 1.2MB 5.25" drives.

A friend and I recently tried an external high density drive (made by NEC) designed for AT clones. It could read 720K diskettes but little else. It could not read 1.4 MB PS/2 diskettes at all. Probably the controller is incapable of recognizing this format - DiskMech said the tracks were blank.

Perhaps these beasties could be run through a hard disk controller, like Supra's 10MB floppies. If not - I fear it may be hopeless.

To: info-atari16@score.stanford.edu

The difference between the current ST floppies and the 2 megabyte ones is similar to the difference between the floppies on an IBM PC-XT and a IBM PC-AT. Basically the clock rate is doubled, letting you pack in twice as much information.

The consensus among the hardware people I've talked to is that the WD 1772 that's currently in the ST can't handle a higher clock rate. However if you removed the 1772 from the motherboard and replaced it with a daughter board with appropriate clocks, controllers, etc. you could get the hardware set up correctly.

The software incompatibilities you'd see would include:

the desktop disk formatter and copier probably wouldn't work
(but there are public domain versions of both of these available)

nothing knows about "switching" densities; i.e. you'd have to
invent some way to dynamically change clock rates

dgc

From: tektronix!sequent!mntgfx!dclemans@ucbvax.Berkeley.EDU (Dave Clemans)
Subject: Re: Mega STs
To: info-atari16@score.stanford.edu

There are two major causes of incompatibility with the blitter rom's
(as used in the Mega ST's)

Essentially all of the "undocumented" low memory locations have moved.

A MAJOR bug in the read portion of the floppy driver was fixed.
This bug had two symptoms that people might have encountered:

error status might not be correctly reported after a read that
got an I/O error

If running a program that used BIOS calls to directly access the
floppy (for performance), multi-sector reads were not reliable

(assuming that the BIOS listing ATARI sent me as part of the developers
kit accurately represented the old ROM's, the bug was caused by mis-using
a WD-1772 sector read command).

From what I've heard, the floppy read bug fix is what has caused most
compatibility problems; it seems some manufacturers of copy protected
software (mainly games) based their copy protection on a side-effect
of the bug. Based on my experience the other areas aren't as major;
the only packages I know of that were affected were the "twister"
formatter that came from STart and possibly GFA basic.

==========

How much memory you want depends on what you do now, and what you
might want in the future. My system (4 megabytes) normally runs
with slightly under 2 megabytes free. The rest is taken by a 800K
ram disk, a LARGE disk sector cache, a large printer buffer, auto-loaded
programs, desk accessories, etc. The whole conglomeration boots in
under 30 seconds, including the time to load about 400K of files into
the ramdisk.

There are also software packages that want memory; the laser printer driver,
Smalltalk-80, OS-9, IDRIS, etc.

You typically just buy them from an apple, or electronics
parts dealer. The Magic Sac is actually quite fussy about wanting to
use (Apple) ROMS (ie. EPROMS don't work).

From: Gribnif%UMass.BITNET@forsythe.stanford.edu
Subject: Bugs in MWC? Also, Re: Disk I/O
To: info-atari16@score.stanford.edu

I have recently discovered a few peculiarities (read: what I think are
bugs) in MWC version 2.0.1:

1) Declaration of integers: you would think that
int i = -32768
would work, since this is a valid number in ones-complement
arithmetic, however this invariably results in the compiler message
'integer "i" promoted to long'. Also, changing the "int" to "unsigned
int" yields the same result whenever you are trying to assign
any number >=32768 (without sign, of course).

2) Try this:

```
main()
{
unsigned long int ii;
int a, b;

ii = 0L;
a = 4097;
b = 8;
ii += a * b;
printf( "%D\n", ii );
}
```

The result I am lead to expect from all my reading is that the number 4097*8=32776 would be stored in "ii", however the compiler fails to convert the result of "a*b" to unsigned long before adding it to "ii", so what gets stored is -32760, the ones complement of "a*b". The only way you can get this to work correctly is by specifying the type:

```
ii += (unsigned)(long)(a * b);
```

Notice also that I did not use "(unsigned long)", as this does not work either.

Ok, is it just me, or are these truly bugs? I'd kinda like to know before I send that small incendiary device off to Chicago...
Also, on the subject of the "f" I/O functions vs. the "F" ones, I recently used fread to load a large (c300K) file directly into memory from my hard disk. What I found was that not only did fread take about 4 times as long to read the file, but it also started overwriting previously loaded data. I tried loading it in different size blocks (starting at 16K, all the way down to 128 bytes, which is smaller than the buffer size) with the same results. Actually, in this case it made much more sense to Fread anyway, since it takes a long as an argument, as opposed to an unsigned int for fread.
Sorry about the length of this, folx, I'm just making up for all those times I wanted to put in my two bits and never got around to it...

The beta version of GULAM had been posted to comp.binaries.atari.st not long ago. It is terriffic, only I have been having trouble having it run out of an AUTO folder at boot. It crashes with two bombs...:-<. The alpha version ran that way with no trouble. Any suggestions?

Marty

I wondered about this also, for some time. Then I decided to
test it out. A friend and I each wrote the same program, but
I used the capital F calls, and he the lower case f calls. I
even put more bells and whistles into my program, and the speed
is significantly higher, even accounting for the fact that I
have to do my own buffering and managing.

8K to 16K are the best speeds, to get the most out of your
floppies. I haven't done any tests to see how much difference
buffer size makes on a hard disk (my Supra died!).

In the referenced article, jdn@homxc.UUCP (J.NAGY) wrote:
>
>Has anyone succesfully uudecoded the recent GULAM postings?
Yup. I saved all three parts to one file. Edited it with vi
and removed the header of the first part. Searched for the
line that started with include
and deleted it down to the table line of the second part and
make it seamless, i.e. all lines starting with X
and did the same connecting the second part to the third part.
so when I finished the whole file looked the same (after the
first table header) with each line starting with the same character.
Ran uudecode on it.

Ditto for the doc file. arc said they were ok, so I downloaded them
to the ST and de-arced them there. They were fine and I've enjoyed

using the new Gulam.

Hope that helps.

Subject: Wanted: GKS, PD Languages INFO
To: info-atari16@score.stanford.edu

Does anyone have any information on a public domain GKS for the
ST? I am thinking about creating one for a project, but will
not spend the time if one exists.

Also, What type of public domain languages are available (high-level)
preferred. Possible languages: Fortran (not preferred), Pascal,
or C. I would be writing the aforementioned GKS in a PD language
as it would be used for a college graphics class, and we don't
want to spend a lot of money if we can help it.

This is a VERY slow way to do it. Especially on LARGE files where
the seek is worse than the open.

Why not just use Fsfirst and read the file size out of the DTA?
This works on both Gemdos and MSdos.

Subject: Hard Disk woes
To: info-atari16@score.stanford.edu

Well, here's to hoping that someone on the Net can help me with
my hard disk problems. My Supra 20Mb recently took a dislike to booting.
It usually won't autoboot, and even booting from floppy doesn't seem to
work. Most of the time it acts like it wasn't connected, but I have checked
to make sure the cable connections are tight, the power is plugged in okay,
and stuff. It's not too warm, nor too cold. And I've had it do this (i.e.
act like it was disconnected) while I was using it; suddenly I'll get
"Data on drive ?: may be damaged..." pop up.

Has anyone else had this problem? I called Supra's technical
support line, but the guy on the other end wasn't too helpful, and before
I send the entire thing back to Supra, I want to see if it can be fixed
easily. (I'm hoping that it's just something stupid I've overlooked, so
I won't have to mail it.)

Oh, and I have tried hooking it up to another ST. It didn't boot.

Preston Bannister and Matt talk about (to my mind, d*mned baroque) ways
to get the size of a file in the context of the MWC programming environment.

Try stat(). That's what it's for, among other things. It also works on
Un*x, which to my mind is a far nicer thing to have compatability with than
mushdos. One trap you are ignoring is: what if the file is a directory?
Nice to have it's attributes, perhaps?

hmmpf grump mutter. (its 5 am and my code *still* doesn't work. Someone
must pay, and as luck would have it, you two win...)

> -ravi

This isn't the problem it might appear to be.

First, the ROMS are quite readily available.

Second, Apple people have been helping the Magic Sac's developer
to improve the product. In fact, there is talk that with
the help he has been getting from Apple he might reverse himself
and produce a 128K ROMs version after all (he had said
previously that he had no plans to do so). Apple doesn't view ,
and I agree with them, the Atari + Magic Sac as competition.
Their view is that it is of a good cheap form of advertising for
them and helps to keep the software production for their
system from being chiseled at by Atari Developers. Software
houses won't bother to produce a port to the Atari
native abomination system if they can just support the Magic
Sac with their Macintosh version.

fixed in the new version. However, I tried a 'cat file1 >file2' and only
saw file1 put to my screen. file2 was created with 0 byte.
Did someone asked for a copy of OSS Personal Pascal? What next? Publishing
Partner? Graphic Artist? :-}
For those having problems with uudecoding GULAM, if you're desperate,
send me a SASE with a diskette, I'll copy my GULAM and send it back to you.
This is one product worth getting!

Someone asked for the docs for rx/sx which was omitted in the OLD manual
but included in the new manual. I extracted this from the new docs.
Also to get back to ue after temporarily exiting using ^Z, do a fg.
Does this answer your questions?
---
rx/sx

These are built-in commands. `rx' receives a file from the remote
system; and `sx' sends a file to the remote system using Xmodem
protocol.

rx FNM

command opens/creates file FNM for writing. If the shell variable
`rx_remote_cmd' is set, *Gulam* constructs a command for the
remote system as `$rx_remote_cmd' FNM, and sends this command
through the rs232 port, and then awaits the packets. For use with our
4xBSD Unix, we set this var to `xm st'. Unless the `xm' on the
remote machine is of the quiet type (one that does not respond with, say,
`Xmodem: Ready to send...'), setting `rx_remote_cmd' actually
prolongs the first synchronization. If this var is unset, you should first
switch to remote (say using te command), and issue the appropriate command
to the remote, and then switch back to AtariST and give the `rx'
FNM command.

sx FNM

is essentially similar. *Gulam* opens FNM for reading, sends
`$sx_remote_cmd' FNM, if that var is set, and awaits the first
sync. For our 4xBSD Unix, we set `sx_remote_cmd' to `xm rt'.

If sending/receiving binary files use `xm rb' or `xm sb'. Note
that files received with Xmodem usually contain extraneous bytes at the
very end of the file. With text files, you often see a bunch of
`^Z's.

The Fseek operation doesn't actually cause any physical disk activity.
All the file system has to do implement Fseek is change it's internal
'position in file' number. (Assuming that the file system
implementation isn't incredibly brain-damaged :-)

^^

Folks,
We've got this straight from the source, and we're going to look
stupid as hell, if we keep saying "it'll never fly", and end up
craning our necks to watch it go over.

Atari may have done some incredibly dumb things in the past; they've
also built the Atari 800, a dynamite graphics engine for its day.

The described Atari/Transputer hookup is an exciting idea. If and
when it works, with a really good OS, it will blow the socks off
anything else in sight.

That makes it a fantastic opportunity for those of us easily seduced
by raw power. I really do want to do real time roaming through the
Mandelbrot and Julia sets, in the comfort of my living room.

I think everyone who is into great home computers should be cheering on the PS/2, the latest Mac-wonder, and now Atari's newest goal. Each does something to open up the market, spur competition, lower prices, and add capabilities.

Thanks to Neil for coming into enemy held territory to make a very temperate and informative posting.

Try to think of this as the opposite of "no man is an island": every improvement in the home computer market's offerings improves my prospects for my next machine, no improvement "diminishes me".

So, I love my Amiga, I use it for hours every day, you couldn't rip it from my bleeding fingers, but GO ATARI!

Kent, the man from xanth.

160. Support for shared libraries on the Atari ST

Shared Library Support - Experimental
-------------------------------------

The included files make up the pieces you need to create and use
shared libraries on the Atari ST. Note that this is a experimental
version. I would like your feedback, especially constructive
comments! :-)

Shared libraries are a useful way of factoring the common code out of
your programs. If you have a number of programs that use many of the
same routines then you may want to use a shared library.

In this scheme, shared libraries are installed at boot time. Each
library maintains an array of pointers to it's externally accessible
entry points. Programs that use a shared library acquire a pointer to
the library's entry points. An entry point is called by jumping
through the array.

The program LIBS.PRG (containing the basic shared library support)
should be placed in your AUTO folder, followed by the shared libraries
themselves. An example library XLIB.PRG is included in this
distribution. At boot time GEM will execute LIBS.PRG, installing the
needed shared libraries support. As each library is executed it will
perform any needed initialization and install itself in memory.

Note that the order of the files in the AUTO folder is critical. The
program LIBS.PRG must preceed any libraries. Also note that if a
library is dependent on the presence of another library, then the
library on which it depends must be installed first.

One of the interested possibilities offered by this scheme is the
ability to easily make incremental changes to existing libraries to
which you may not have the source. If there is a known bug in a
library, you could come up with a 'patch' that replaces the offending
entry in the library's jump table with a pointer to your own routine.

Support routines
----------------

-- int InitLibSupport()

Called by any program using shared libraries to initialize the shared
library support. Returns 0 if the shared library support is NOT
installed.

-- InstallLibrary(lib_link,keep)

Called by a library to install itself.

-- Library FindLibrary(lib_name,lib_version)
```

```
Called by a program to find an installed library. Returns 0 if the
library is not found, or a pointer to the library's array of entry
points.

This distribution contains the following:

LIBS.H - included by all code using shared libraries
LIBS.C - terminate & stay resident library support
LIB_INIT.C - module linked in by programs using libraries
LIB_INST.C - module linked in by installable libraries

XLIB.H - interface to example library
XLIB.C - example library

XTEST.C - program that uses example library

MAKEFILE - to put all of the above together

This code was developed using Mark Williams C.

>a command called 'rx', but rx doesn't exist. Can someone tell me what these
>commands do?

The command 'rx' is to receive, using xmodem protocol, and 'sx' is to send.
In the beta version that I have, I have used these commands to move
files back and forth between the remote 4.3 system at the office.
I put these lines in my GULAM.G file.

```
set rx_remote_cmd 'public xmodem st'
set sx_remote_cmd 'public xmodem rt'
```

I used the Gulam command

```
% sx file.ext
```

to move a text file from the ST to the remote system and the command

```
% rx file.ext
```

to receive a file.

>2) From ue (emacs) when you type a ^Z is 'temporarily' pops you into Gulam
>and your editing buffers are not FREED. The manual says to try this but
>doesn't say how to return to emacs. So far I only tried running emacs
>then ^x^b to the buffer i was editing. Is there a more direct way to return
>to your editing after doing a ^z .

Try the command 'fg' to bring the background job to the ForeGround.

Apollo has this today - NCS - Network Computing System. Basically
a program can call subroutines on other machines on the network.
Even different computers (Cray's to PC's) on heterogeneous networks.

This was demonstrated at the national Apollo user group meeting in
San Francisco. They had about a dozen machines all hooked together,
ranging from 8Mhz 68000 to 25 Mhz 68020 to high end bit-slice
beasts. One computer ran a mandelbrot program. You zoomed in
on an area with the mouse, said "go" and ZZAP! 32 x 32 pixel squares
started coming in over the network. It was wierd to see the picture
'fade in' in little squares, but my oh my, it was fast. They also
had a ray tracer. Equally impressive !

I met one of the members of the Apollo 'midnight movie crew', and
we talked for a while. When at one point I mentioned a Cray, he
got quite mad and said "Why in hell would I want a Cray ? We have
a network of 2000 machines, of which at least 1000 are up at any
point in time. Everybody goes home at 5:30, and *poof* I don't
need a Cray. 30 DN 3000's is all you need to see damn near real
time ray tracing"

(DN3000 is 16 Mhz '020)

August 9, 1987 uupc Questions and Answers uupc Development

The following is some commonly asked questions about uupc and, of course, the answers to these questions.

1. What does "uupc" stands for?

It is an acronym for "UUcp for PC's", but it is also a pun on uucp, which is in turn an acronym for "Unix to Unix CoPy".

2. What does uupc do?

It gives a personal computer the capability to become a "node" in the UUCP (or a similar) network and exchange information such as electronic mail and USENET news with other computers on that network.

3. What personal computers does uupc runs on?

Currently it is available for the Apple Macintosh, Atari ST, Commodore Amiga, and IBM PC (and compatibles) with DOS. More computers and operating systems will be able run uupc in the near future. (IBM PC with MINIX is a likely next candidate.)

4. Does uupc require me to leave my computer on all day to wait for incoming mail?

No. Most people only use uupc to call up their neighbouring system to send and/or pickup mail at times convenient to them. Outgoing mail are also spooled to disk and do not need to be send immediately to your neighbouring system after it is composed.

However, uupc can also be set up on a personal computer to wait for incoming call continuously and act as a "mail-hub" to relay messages for other systems if you choose.

5. What do I need to have to get uupc up and running on one of the above personal computers?

You need a neighbouring system to communicate with. This system can be either a UNIX system, another personal computer running uupc, or any other system that can talk UUCP's 'g' protocol.

You would also need to have the appropriate C compiler for your personal computer if you have received only the source for uupc.

6. Is the source to uupc publicly available?

Yes. It was posted to the USENET newsgroup comp.sources.misc in August 1987 and is available from (at least) any site which archives this newsgroup. If you have trouble locating a copy of the uupc sources, please drop uupc Development a note through one of the e-mail addresses listed at the end of this file.

7. What does the uupc software consists of?

It consists of two programs, uupc and pcmail. uupc is an automated files transfer program, similar to /usr/lib/uucico in UUCP, and mail is a mailer user-interface, like mail(1) in UNIX.

8. What are the typical use of these programs?

uu is used to accept incoming file relayed to you through your neighbouring machine and deliver outgoing file to your neighbouring machine for forwarding to other machines. In most cases these "files" contain electronic messages which are to be used with the mail program.

pcmail is used to read incoming mail delivered by uu, and compose outgoing mail for delivery with uu. However, it can also be used to transfer files to/from other systems that is reachable through electronic mail.

9. What do I need to do to get uupc running on my personal computer?

You would need to obtain the binaries of uupc for your computer by either compiling the uupc sources on your machine or obtaining the uupc binaries from someone who has a copy.

You would also need to arrange to have your neighbouring system to recognize your system as one of their neighbouring systems in the network. The procedures for this varies, you should contact the people who manage your neighbouring system for about details.

10. Does uupc supports more than one neighbouring systems?

Yes, it can support multiple neighbouring systems. The mail software will currently always route outgoing mail through one of these systems, but a future version of this software will allow multiple forwarding machines for outgoing mail.

11. Is uupc the same program on all systems it runs on, or is it actually a different program for each of the systems?

It is the same program across all systems, with the exception
of the system-dependent code, which is different from system
to system.

The user-interface and command line options for uupc are also
uniform across all the systems it runs on, so there is no
need to learn a new program when you use uupc on a different
computer. The uniform user-interface also makes it easier to
use uupc on different computers at the same time.

12. If I don't like the mail program's simple user-interface, are
there any alternatives?

Since a mailbox can be easily converted to a simple text
file, alternative mailer can be easily written to accomodate
different needs. At the very least, you will be able to use
your favorite text-editor to read your incoming message and
compose your outgoing message.

Future release of uupc will include mailers for the different
systems which will take advantage of special features only
availabe on the systems they run on (e.g. window and mouse).

13. What if I want to port uupc to another personal computer not
presently support by uupc?

First you should read the file UUPORT.INF, which should be
available from the same source you obtained this file from.
If you cannot locate a copy of this file, then please send a
request for it to uucp Development at one of the e-mail
addresses listed at the end of this file.

After you have read the above file and decided that you still
want to do a port of uupc to a new machine/operating systems,
please drop uupc Development a note at one of the the e-mail
addresses listed at the end of this file. This way we will
at least be able to save each other from duplicated efforts.
Who knows? We might even have a version for ready for your
system when you call to tell us that you are about to begin
your port.

14. Who/what is the "UUPC Development Team"?

The original software (dcp) was done by Richard H. Lamb.
Modified to run on the Mac by Stuart Lynne.
Atari ST by Lawrence Harris.
Amiga by Jeff Lydiatt.
IBM-PC/MS-DOS by Samual Lam.
VMS (not available yet) by Lawrence Harris.

15. What is the copyright status and distribution policy of uupc?

The dcp portions of uupc are Copyright (c) Richard H. Lamb.
Modifications Copyright (c) Stuart Lynne.
Mail, PCMail Copyright (c) Stuart Lynne.

Mac software Copyright (c) Stuart Lynne.
Amiga software Copyright (c) Jeff Lydiatt.
Atari software Copyright (c) Lawrence Harris.
IBM-PC/MS-DOS software Copyright (c) Samuel Lam.

In general we are promoting the use of this software on a
"public domain" basis. You can use for your own use, and
can give copies of the source code to anyone, provided you
provide this information to them.

16. If I have more questions, comments, or suggestions about
uupc, where should I send them?

Please send them all to us at uupc Development at one of the
e-mail addresses listed below. We also welcome any bug fixes
and improved/new code for uupc that you might want to share.

uupc Development can be reached at the following e-mail address:

uupc@van-bc.UUCP

This is routed to the uupc mailing list and a local news group
for discussion of uupc software.

To join the mailing list send a request to:

uupc-request@van-bc.uucp

17. Can I get the binaries of uupc mailed to me?

Yes and no.

No, we cannot e-mail binaries to you at this time.

Yes, if you send a self-addressed and stamped (international
coupon) mailer with appropriate diskettes (2) we will attempt to
return them to you with the appropriate version of the software.

We plan to make a binary posting to the appropriate USENET
comp.binaries.* newsgroups in the late fall, or early next year
when the software is a bit more functional, better documented
and easier to install and operate without the sources.

Mail your disks to:

UUPC Request

164. Source for a system() routine needed

Newsgroup: comp.sys.atari.st
Date: 1987-11-15 07:08:09 UTC
From: preston@felix.UUCP
Message-ID: <13021@felix.UUCP>
Source record: 256114

Has anyone out there implemented a version of the system() library routine that uses the Mark Williams/Beckmeyer scheme for passing long argument lists?

Unfortunately, the system() routine in the Mark Williams library does not. The argument list gets truncated after 127 characters.

I am using the modified version of the 'make' program posted to this group some time ago. Some of my makefiles want to pass long argument lists (usually on the step linking together a program). The argument list gets chopped off at 127 characters, which is somewhat annoying.

[]

One way to go would be to buy the ST-->composite video cable that
is sold by E. Arthur Brown Co. ($20) - that's all you need to plug
into your VCR or monitor/tv. To attach to a standard TV (why do they
allow them to make them without video input jacks?) you can then
add one of those $5 RF modulators occasionally on sale in Radio Shack,
etc. Has anybody tried this? What is the picture quality?

- Moshe Braner

166. Re: IBM-PC floppy disk format

Newsgroup: comp.sys.atari.st

[We wear two caps around this place, since we are UACE and DC]

We have a new version of the corner clock coming out real soon that:
1) Works with the new and old ROMs, and
2) Actually keeps correct time (sorry, our old one was subject to bad
vblank timing on some computers).

New software:

DC Transfer - a background file transfer facility (works with just about
everything we tested)

DC IO - a psudeo 11 sector disk formatter (actually 5 1k sectors and 1 512 byte
sector) that works as FAST as 9 or 10 sector FAST formats.

+ version 2.3 of DC Formatter.

Look for these soon.

and [maybe one of these days] ZENITH Term and ZENITH BBS.

- Mike Vederman

Source record: 256120

Hi all, a few weeks ago I posted that I had my ST system for sale.
The reason for selling is to move up to a Mega 2. I have sold my
SF314, and the Magic Sac, I still have the 1040 ST and SM125 for
sale. Included with this machine is a new Parr. printer cable,
anti static dust cover, and Sub Battle from Epyx. The monitor
belongs to the local Atari dealer, but he will let me sell it with
the system to help me sell it, so the monitor is brand new, with
full warr. If interested in this system reply here on the net or
call me at 1-(902)-542-2312. I want $1100.00 Can. for the system.
I will most likly through in any other little things I find
kicking around my desk.

I'd like to add to the brief information in the sidebar of the article
you cite. The information that a NeWS server exists for the 520 ST
comes from two sources: first, James Gosling said it was done as an
excercise in a talk he gave on NeWS at the 1986 Fall DECUS symposium in
San Francisco. Second, the same assertion appeared in the
transparencies used in a seminar given by Sun Microsystems on NeWS.

In neither case was there the suggestion that the implementation was
for sale, nor available via some public domain channel; my guess is
that your "vague recollection" is correct, and it's not, but the best
way to find out is to contact Sun directly.

Jim

Subject: IKBD commands/reads

Is there an easy way to get the clock time from the keyboard?
It would be nice to use a clock with one second resolution instead
of GEMDOS's 2 second clock.

I would also like to be able to set this clock.

I know that there is an XBIOS call to send bytes to the keyboard,
but how do we receive them? (I have no idea where the keyboard
packets are sent or what format they have or ... you get the picture. :)

Just in case anyone cares, I'm using Personal Pascal.

]At one time (quite a while ago) there was quite a bit of discussion
]about "Someday SOMEBODY is going to come up with the means to drive a TV
]from a 1040ST".

And so do I!
I know this can be done; there was a description and a sample of a circuit
that would do this in Bruce "sublogic" Artwick's book on computer graphics.
I believe it was titled _Microcomputer_Graphics_and_Animation_.

I also keep hearing about some company called JNL Technologies that
apparantly made one of these dodads.

This device would be a boon to all the ST owners without RF output (520ST[f]s
have RF output as you all know) who want to videotape some screens.

Subject: uw & different fonts for microemacs
To: info-atari16@score.stanford.edu

I have 2 questions for neters concerning uw and emacs:

1. What exactly is uw ? Is it a window manager ? Is it compatible with X window
system version 11 ? If it is, can it run over dial-up phone line or does it need to
have a high speed network to work ?

2. Is it possible to load a 6x10 font to be used with mg(microgNUemacs) or me(microemacs) (I have a ME version 3.9 that has 40 lines display on monochrome
with font width of 8 pixels, and also a MG version 1a that can display 50 lines
if I run "hi50.tos" first but the width of the character is 8 pixels so it is
kinda hard to read). Better yet can proprotional fonts be used instead of monospaced
fonts. I realised that it is hard to used get a font with width of 6 to work with
TOS (since 640 divided in to 6 is 106. something) but is it impossible?

Thanks in advance for any helpful information,
Hai

PS: I guess that was more than 2 questions...

> ensure that our consumers get prompt service.

And I guess that is the real problem here... I talked with
one of the local dealers, and they plan to fix MEGAS just like they
fix 520/1040's ===> "Oh, so your ST is sick? Bring it in and we'll charge
you X dollars, and you can take it with you... Never mind that the
serial number is different." That's right... most dealers here fix STs
by simply replacing them with a new one - very "prompt service", and they
don't need (or intend) to use your $4000 worth of parts!

And besides, who do you think really pays for those part
anyway ;-(. I think that this whole thing boils down to Atari wanting
the "image" (or should that be "look and feel" ;-)) of an IBM
dealer - high prices, fast service, and very few customers who can
afford all of that glitter.

From: umn-d-ub!umn-cs!ems!nis!stag!trb@speedy.wisc.edu (Todd Burkey)
Subject: Re: Atari/Perihelion Transputer Machine Spec
To: info-atari16@score.stanford.edu

If I hadn't seen the exact same CD-ROM being displayed in several
non-Atari booths (i.e. for the IBM PC) I would be skeptical about
whether it would ever make it out either. My only concern is that
it sells for $999 on the PC. It really was the same unit, too. Only
the case color was different. As for the Transputer, I was really
impressed with the progress they (Perihelion) had made. We have some
Transputer's at work (boards for the AT) that are pretty loosely
integrated (kind of like an exerciser kit), and the ABAQ definitely
had progressed far beyond that. I ALMOST ordered the $100 set of
preliminary manuals to become a developer (I can think of lots of
CAD tools that would be nice to port...Place and Route Previewers,
GDSII compatible layout editors, etc...but I couldn't get any good
feel for what the final costs would be to get a full set of developer
hardware.) If any of people actually do order the kit, let us on the
net know how it looks.

-Todd Burkey
trb@stag.UUCP <--faster path
or tburkey@eta.swde.com <--shaky sun<->apollo (I want Aegis 10!)

P.S. I just got through porting HDSCAN to my Symmetrics, the Apollo,
and the Sun. It runs very nicely on any standard 4.2 system (kind
of slow on the Apollo...usable on a 3000). After I clean up a few
things and add some more sort options (gid/uid/other times?) I
will have to decide if I am going to make it public domain at the
source level or what...BTW, it takes a lot longer to traverse
trees using Unix opendir/readdir/stat calls than it does on the
ST (3 secs/30 megs on the ST vs 40 secs/24 megs on the SUN 3/60
with Eagle drives...>2 minutes for the same on the Apollo).

Date: 12 Nov 87 17:29:35 GMT
From: umn-d-ub!umn-cs!ems!nis!stag!daemon@speedy.wisc.edu (Dale Schumacher)
Subject: file i/o functions
To: info-atari16@score.stanford.edu

Hopefully the following will help clear up the confusion about file i/o
functions...

Fread() is one of the macros which calls Gemdos through trap #1. This is
an exerpt from the <osbind.h> file containing there macros:

```
#define Fcreate(fn,mode) gemdos(0x3C,fn,mode)
#define Fopen(fn,mode) gemdos(0x3D,fn,mode)
#define Fclose(h) gemdos(0x3E,h)
#define Fread(h,cnt,buf) gemdos(0x3F,h,cnt,buf)
#define Fwrite(h,cnt,buf) gemdos(0x40,h,cnt,buf)
#define Fdelete(fn) gemdos(0x41,fn)
#define Fseek(where,h,how) gemdos(0x42,where,h,how)
```

These functions work much like the standard low-level i/o calls. They
use a small integer (returned by Fcreate/Fopen) called a file handle to
refer to the file (the 'h' parameter in other calls). As was mentioned,
the parameter order is different from the standard low-level i/o calls,
and the 'cnt' parameters are long values rather than the int than is normally
used. The following are macros which define some of the low-level i/o
calls in terms of their Gemdos equivalents.

```
#define open(filename,iomode) ((int)gemdos(0x3D,filename,iomode))
#define close(h) ((int)gemdos(0x3E,h))
#define read(h,data,len) ((int)gemdos(0x3F,h,((long)(len)),data))
#define write(h,data,len) ((int)gemdos(0x40,h,((long)(len)),data))
#define lread(h,data,len) (gemdos(0x3F,h,len,data))
#define lwrite(h,data,len) (gemdos(0x40,h,len,data))
#define unlink(filename) ((int)gemdos(0x41,filename))
#define lseek(h,where,how) gemdos(0x42,where,h,how)
#define tell(h) gemdos(0x42,0L,h,1)
```

The creat() call is notably missing from the above due to a bug in the underlying gemdos 0x3C function which sometimes creates a new file with the same name as an existing file instead of overwriting the old file. Thus creat() is implemented as a function something like this:

```
int creat(filename, pmode)
register char *filename;
register int pmode;
{
register int rv;

rv = Fdelete(filename);
if((rv == 0) || (rv == -33)) /* SUCCESS or FILE-NOT-FOUND */
rv = Fcreate(filename, pmode);
return(rv);
}
```

Now we come to the fread()/fwrite() functions. These are standard i/o functions which deal with STREAMS rather than simply with FILE HANDLES. Unlike the above, these functions provided buffering and translation of newlines, if desired. They are used with fopen()/fclose() functions. The fopen() function returns a pointer to a FILE structure, which contains information about the stream that was opened. The fopen() function also handles the open()/creat() distinction, creat()ing a file if is doesn't already exists, etc. As was said before, this kind of processing does make the i/o a little slower, but also easier to use. The fputc()/fgetc() functions are normally used with streams (getchar()/putchar() are written in terms of fputc()/fgetc()) to do i/o a character at a time, while internally buffering the calls to prevent a system call for every character processed (which would be slow). The fread()/fwrite() functions do block i/o on streams, and are buffered just like single characters.

In summary, you should avoid using Gemdos calls directly, since it is not portable and it doesn't gain you any speed. Use the low-level i/o if you're really concerned about speed and use the stream i/o functions if you're doing mostly character or string i/o and/or want the buffering done efficiently for you.

The preceeding examples were taken from the dLibs public domain standard library for Alcyon C. This implmentation is far freer of bugs and much more efficient in general than the Alcyon/DRI libraries. dLibs also contains many Un*x standard functions which were not included in Alcyon/DRI. You can get a copy of dLibs with complete source code and documentation by sending $3 to:

Dale Schumacher
399 Beacon Ave.
St. Paul MN 55104

Of course, I won't refuse donations of >$3, but I need to at least break even with buying the disks and mailers and sending them.

> The maximum is 13.

Internally.

The ABAQ includes 3 "links", which are 10-megabit-per-second serial
interfaces for talking to off-board transputers.

Jack Lang, in his talk at the Atari press conference at Comdex, supposed a
setup where workers each had their own transputer system on their desks,
with all of them linked together and linked to a separate box containing
many transputers. As an application's need for processing power increased,
it could pull more transputers in. An intriguing concept -- throw the
computer into high gear.

The current version works only with a color monitor as the packaging states.
There is a zap to 'turn on' the screen in a monochrome system but it is
NOT a fix and the resulting screen is barely readable.

Version 3.0 is at the duplicating house. It features mono support, Microsoft
mouse emulation, TOS time/date transfer, bug fixes, etc.

173. Currently Indexed items on umix...

Newsgroup: comp.sys.atari.st
Date: 1987-11-16 03:08:13 UTC
From: usenet@delrio.cc.umich.edu
Message-ID: <3880773b.c6e5@delrio.cc.umich.edu>
Source record: 256123

Howdy folks. Just letting you know what I've got here on umix.cc.umich.edu... Note that I'm going to be moving to a new job relatively soon, and I suspect it'll take me some time to move these archives with me... Please - if you can fill in the holes that have cropped up, send me mail!

I'm looking into setting up an exchange with the folks at UOGUELPH, who apparently take care of the CANADA01 server (?) on Bitnet. Eventually the University's big IBM mainframe is going to be connected directly to Bitnet, so things may be easier then, but for now, Bitnet connectivity is a real hassle, so the less I have to deal with it, the better.

Other notes... The termcap file recently posted to the comp.sources group has a slight error - the entry for 'st52l' has the wrong definition for the 'cm' cursor motion sequeunce. The entry for the 'st52' is correct, just look for the 'cm' definition and make the st52l entry match the st52 entry... (Sorry about that, I was still messing around when I sent that to Turner...)

Also, the version of termcap that's linked into the larn executables now seacrhes along the path for the termcap file, as well as in the current directory and in \etc on the current drive. There's a routine named fopenp that I stuck into the termcap source files; it more properly belongs on its own, so it can be linked into other programs... (fopenp stands for 'fopen on path'...)

Has anyone tried out Larn yet? I left out a small routine in the posted version... In the sources, this is in tok.c, the flushall() routine. Since I knew nothing about how the TOS calls worked at the time, I left flushall() to be just a NOP. This is the routine that flushes the input buffer, to prevent you from doing something you'd regret should the situation change drastically between the time you filled the buffer and the time the command gets processed. It *should* be something like:

```
(at beginning of tok.c)
#ifdef GEMDOS
#include <osbind.h> (in addition to what's already #included...)
#endif

(at definition of flushall - this should replace the line '#ifndef GEMDOS')
#ifdef GEMDOS
while (Cconis())
Cnecin()
#else
```

The index for the binaries follows, with the sources next, and finally a list of the things I've picked off the comp.sys. group... Also note, only parts 1-3

of the Larn sources were posted to the binaries group, and then the complete sources were posted to the sources group. Looks like Turner was so eager to get it out the door after all this time that he made a slip-up... }-)
I've linked the entry in the archive directories so the source ARC file is present in both the binaries and sources directories. Also I'm putting my copies with the above fix in, as opposed to the actual posted material.
(But I *have* successfully decoded and extracted what Turner posted, so don't worry about that! I've decoded and tested everything that's been posted, when possible. Having only a monochrome monitor, well... Whatever.)

Well, there'tis. So far, it seems people have been reasonable in their use, as in only trying to connect during off hours. Thank you for your consideration. As my new job situation sorts itself out, I'll be bringing more stuff online from the older editions of Info-Atari (as snatched from Ravi Subrahmanyan... Thanks again, Ravi!). And again, if you see holes in these lists that you can help fill, drop me a note, eh?

Source record: 256124

>The ABAQ includes 3 "links", which are 10-megabit-per-second serial
>interfaces for talking to off-board transputers.

Should I read this a yet another version of tcp, nfs and ftp but
made by atari to be incompatible with all other manufatures?

>Jack Lang, in his talk at the Atari press conference at Comdex, supposed a
>setup where workers each had their own transputer system on their desks,
>with all of them linked together and linked to a separate box containing
>many transputers. As an application's need for processing power increased,
>it could pull more transputers in. An intriguing concept -- throw the
>computer into high gear.

Atari makes parallel computers and a presume an operating sytem that
will allow multi-tasking and multi-processors with a relitivly new and
unkown chip, hmmm. Interesting coming from a manufacturer that can
not make a single user single taking os with a well known and popular
chip. Sounds like vapor-ware to me.

>David Hawkins {ptsfa,hplabs,ucbvax}!well!dhawk
>It is a luxury to be understood. - Ralph Waldo Emerson -

I like to uudecode the files on the host UN*X machine, and then transfer
the arc files directly (takes less time...). Since each part is
surrounded by News garbage, they have to be fitted together as described
above. The editor method gets pretty tiring when you get 11 part archives!!
Here's what I do: First save each part in it's own file such that * will
reference the files in correct order (I use the part number 01, 02,...).
Then run this shell script with the files as arguments:
csh:
#!/bin/csh
file=$1
sed -e '1,/^@ABCDEFG/d' -e '/^include/,$d/ $file > x.uue
shift
foreach file ($*)
sed -e '1,/^begin/d' -e '/^include/,$d/ $file >> x.uue
end
exit
ksh/sh:
#!/bin/sh
file=$1
sed -e '1,/^@ABCDEFG/d' -e '/^include/,$d/ $file > x.uue
shift
for file in *
do sed -e '1,/^begin/d' -e '/^include/,$d/ $file >> x.uue
done
exit

Now run uudecode on ``x.uue''. This works like a charm, and saves much
editing!!

I believe that cable only works on 520ST's, which already have RF output and 2 pins on the monitor port for composite output. 1040's do not have these pins (unless your 1040 has a rf output port). The pins are labeled in the gray manual in the back.
So the 1040 users (what about megas?) are still without rf output for now.

178. RTE causing bus error

Newsgroup: comp.sys.atari.st
Date: 1987-11-16 05:49:00 UTC
From: nicholso@ihlpm.ATT.COM
Message-ID: <1498@ihlpm.ATT.COM>
Source record: 256128

[Line eater, come and get it]

I've recently been developing some code which installs it's own interrupt, and trap handlers. Unfortunately, whenever the code tries to return to the original code a bus error results. For example, if the routine _clock_int is installed as either a trap, timer interrupt, or any other exception handler by the main routine when the rte instruction is executed at the end of the _restart routine a bus error will result. I'm a little lost as to why.

```
_start:

From: 870646c@aucs.UUCP
Message-ID: <558@aucs.UUCP>
Source record: 256129

I have heard some rumors latly about some problems occuring when using
a SH204 with the new Mega computers. I have wondering if there is any truth
to these rumors. The problem is says that the SH204 cannot be used 100% with
the Mega's. From what I have heard so far this rumor is a load of cr*p. If
there is anyone out there using a SH204 with a Mega could you please respond
and settle this rumor for me. I seem to have the only SH204 locally that
does not have to be shut down and restarted when the CPU locks up????

181. BISON and LEX on the ST?

Newsgroup: comp.sys.atari.st
Date: 1987-11-16 18:21:22 UTC
From: preston@felix.UUCP
Message-ID: <13144@felix.UUCP>
Source record: 256131

Has anyone ported, or is working on a port of BISON (the GNU project's YACC clone :-) or LEX to the ST?

I downloaded the sources for BISON and LEX from the IBM-PC roundtable on Genie. Since both programs already run under MSDOS, it shouldn't be too difficult to port them to the ST.

BTW, I have ported the fast 'grep' that was posted to one of the general sources newsgroups. It is _very_ fast. On our VAX the fast 'fgrep' is much faster than the stock fgrep. On the ST the fast grep is perceptibly faster than either the fgrep built into Gulam or the fgrep that comes with the Beckmeyer C-shell. Is anyone interested?

To: INFO-ATA at SCORE.ST

I recently read on this net (by Dale Schumacher) that Gemdos Fcreate
does not work properly. Can someone (maybe Dale) elaborate on that?
I use this function in an editor program, which means quite often for
existing files, and I never ran into problems: Existing files are
properly deleted before a new file with the same name is created.
How can this bug be observed? If I can reproduce it, I have to do the
trick with Fdelete first. But at present I see no need for that.

Roland Waldi

183. Need Printer Software Help

Newsgroup: comp.sys.atari.st
Date: 1987-11-16 18:44:35 UTC
From: walt2@ihlpm.ATT.COM
Message-ID: <1499@ihlpm.ATT.COM>
Source record: 256133

Netlanders,

After spending many hours reading the November 10th issue of PC Magazine, I've decided to buy a Seikosha SL-80AI printer. It gives the most bang for the buck. However, since it's a 24 pin printer I have a new dilemma.

Does there exist publishing software (STwriter, 1STword, or whatever) that handles Epson LQ or IBM 5152 Graphics Printer modes? I'm new at this and I may not know what I'm talking about. I'm about to buy a Seikosha SL-80AI printer that emulates Epson FX, Epson LQ, or IBM 5152 Graphics Printer modes. Since this is a 24 pin printer, I'd like to use Epson LQ or the IBM Graphics modes with my 1040ST. If bad came to worse, I think I could hack something up but I'd prefer to use a professional program if it had spelling checkers and a thesaurus.

I don't want to spend 300 dollars on a printer only to find I'll be doing 3 months of software development just to print "hello world". Any help would be appreciated. Thanks.

184. Memory ugrades...

Newsgroup: comp.sys.atari.st
Date: 1987-11-16 19:57:41 UTC
From: exodus@uop.EDU
Message-ID: <755@uop.EDU>
Source record: 256134

Does anybody have the plans for a 1040ST memory upgrade? I have looked around and found a solderless board for $150, minus chips, of course. Others range from 150-250. Knowing how to use a soldering iron,etc., I'd prefer to do it myself but do not know enough about the internals of the ST-beast. I'd also prefer to use 256 DRAMs since they aren't as expensive as the 1 Megabit DRAMs (from what I have seen so far). The cheapest 1 Megabit DRAMs I have seen are 120 ns for 19.99 at JDR.

Please E-Mail to the address below and I'll post a summary if there is an interest.

Thank you,
Greg

>
> (assembly code follows)

What is that routine supposed to do? Knowing that makes debugging it a lot easier. At first glance, it looks like it could be a task-switcher for a multitasking kernel; is that it? It looks like you aren't doing the same number of pushes and pops to the stack. That could be intentional (if you're doing multitasking), but is a pretty sure way to get a bus error. My advice to you is to trace your code on paper, keeping track of exactly what's on the user and supervisor stacks. Remember that exceptions push the status register and return address to the supervisor stack before running the exception code; make sure you know in what order those are pushed, as that can mess you up too.

Hope that helps.

This may be true, but the 64K ROMs are no longer being produced. This means the number of ROMs is fixed, of which some have been returned to Apple already. I suppose people could be copying the ROMs; if so, they are doing this illegally, and our Legal Department would like to talk to them.

>Second, Apple people have been helping the Magic Sac's developer
>to improve the product. In fact, there is talk that with
>the help he has been getting from Apple he might reverse himself
>and produce a 128K ROMs version after all (he had said

I find it difficult to believe that Apple (as a company) is helping improve the Magic Sac. I have read that Andy Hertzfeld helped (I don't know if this is true or not), but he is not an Apple employee and doesn't represent Apple at all.

I don't agree with the logic that improving Magic Sac helps Apple. It encourages people to buy Atari hardware instead of Macintoshes, which is directly against Apple's interests. The number of Magic Sacs in the world is very small, so it doesn't influence software developers either.

If Apple was supporting this, there would be press releases, articles, etc. so that everyone would know about it.

(The cross-posting of _this_ article is intentional, since it's
the amiga folks who deserve the apology).

I'm going to keep this response short, since I was recently made
aware of an unenforced policy here at the U of Waterloo which restricts
posting by undergrads to non-local groups. Please, folks, when I posted
the pseudo news from Antic, I obviously didn't notice the cross-posting in
the Newsgroups: line. No excuse, so please accept my apologies; however,
slinging insults around is uncalled for. And I know that _I_ appreciate
seeing articles like the one I posted, even as biased as they are.

I had no connection with the duplication of the article, a few
days later. Someone seems to have started to respond, and then accidentally
sent the article instead of aborting.

From: cmcmanis%pepper@Sun.COM
Message-ID: <34044@sun.uucp>
Source record: 256141

NeWS was ported to the ST, by a person here at Sun. It was based on some beta code (which is now mostly different), and it was a server only. Meaning that you could talk to a Sun via SLIP and have suntools run on the ST. This made the ST a nice terminal for the Sun. It is *NOT* a replacement for GEM and it is *NOT* being marketed or sold. If you are interested in porting NeWS you can buy a source license and do so. $25,000 commercial, much less for Universities, although if you want to redistribute the port you need to get the commercial license.

Date: 1987-11-17 02:09:07 UTC
From: fischer-michael@YALE.ARPA
Message-ID: <8711170209.AA27014@ATHENA.CS.YALE.EDU>
Source record: 256142

In reply to Keith Hedger's question about DBMAN:

I have used DBMAN to implement a couple of fairly sophisticated packages which I use all the time. It is really a programming language for writing database applications (similar I understand to dBASE III), so even fairly simple things take some programming to set up. But the primitives are there and they work well. Once you have figured out how to put the pieces together, you can do very sophisticated data entry, data validation, automatic computation of defaults, report generation, and so forth. You can also easily create, combine and manipulate multiple databases, allowing one to implement transaction logs, update files, and other standard data processing paradigms. On the whole I am very pleased with it and find it to be one of the best programs that I have used on the ST.

I just saw an ad for a new drawing program, called Quantum Paintbox by Eidersoft. It makes it possible for the ST to display 4096 colours simultanously. The list price is #19.95 in the UK. Software houses can get a special licence to use the display technique in their own software.
How they do it? I do'nt have the slightest idea. But as I allready have bougt several product from this firm, I don't think it is an advertising trick or vapourware.
By te way, I am not in any way connected with etc. etc.

Greetings,
Ryko Prins

>

One of the problems the new Atari has developed is, not the vaporware problem (that's old) but coming out with a product too late.

Ex. Atari announced their 1200 baud modem quite sometime ago.
But.... Avatex has already gobbled up the low priced 1200 baud market.

Ex #2. Atari announced the CD-ROM (If I'm right, Activenture invented the CD-ROM under contract from Atari) first.
Now, there are other companies making the CD-ROM and Atari still doesn't have their available.

I guess my point is, Will Atari come out with their transputer BEFORE Apple, Commodore, IBM, etc. make their own and STEAL the market from Atari?

Tom

195. 520stfm-->rf modulator-->TV

%I like to uudecode the files on the host UN*X machine, and then transfer
%the arc files directly (takes less time...). Since each part is
%surrounded by News garbage, they have to be fitted together as described
%above. The editor method gets pretty tiring when you get 11 part archives!!
%Here's what I do: [omitted]

For postings such as the 11 part Larn sources there's a much easier way!
First, look at the 'index' that Turner provides with each posting - the
part with the uuencoded lengths and checksums. Notice also that he lists
the name the file was saved as, e.g. larn12s.uaa. These files are labelled
to work with Jean-Pierre Dumas' uudecoder. The sources for that have been
posted - just compile that on your Unix box and go! When the files are
saved with the correct name, the uudecoder will automatically concatenate
things properly. You don't have to edit out the news headers either. That's
what those little 'include <filename>' lines are for, after all... Once
you have Dumas's decoder on your Unix box, it's just a matter of a couple
well chosen 'save' commands in your news reader, and the command 'uudecode'
will do all the grungy work. (And hey, isn't that the way things *should*
be? }-) That's how I've been maintaining these archives... Now, if only
everyone would use Dumas' *en*coder all the time, then we'd be all set...

197. need help - atari monitor adjustment

Newsgroup: comp.sys.atari.st
Date: 1987-11-17 18:11:44 UTC
From: toml@xrxns.UUCP
Message-ID: <242@xrxns.UUCP>
Source record: 256147

i acquired a monochrome atari monitor for pretty cheap a few months back. the only problem is that the display quality isn't really great. though the focus is sharp, the display occupies only a small area of the screen itself, and the display image itself is slightly rotated (clockwise) so that everything runs slightly downhill from left to right.
eons ago i recall seeing some postings about do-it-yourself adjustments to the atari monitors. does anyone have these archived away? if so, i'd greatly appreciate receiving them, or just a quick note from someone who knows how to make these adjustments. i know there is a way of enlarging the image; can the image be rotated too? my setup looks pretty shabby with a couple of dead floppies stuck under one side of the monitor to level the image out!

thanks.

198. ST to pic/troff converter?

Newsgroup: comp.sys.atari.st
Date: 1987-11-17 18:20:00 UTC
From: brads@hcx1.SSD.HARRIS.COM
Message-ID: <46700003@hcx1>
Source record: 256148

Recently I had the pleasure (:-)) of using UN*X pic/troff to make a moderately complex drawing. While the results were completely acceptable, the process of making it (edit, make hard copy, oops!, edit, ...) was not. I am looking for a way to ease the process of making pic drawings. Any good suggestions will be gratefully accepted. It seems that one could use a drawing program on the ST (like Degas) to make the drawing, and then convert the output of the drawing program into pic/troff commands. Has anyone done this kind of thing before? Is there a PD/shareware/commercial filter available to convert popular ST graphics files into pic/troff? Please respond via email, and I will summarize responses to the net.

Cross-posted to: comp.sys.cbm,comp.sys.atari.st,rec.music.synth

Hello fellow computer persons!

I am C-64 owner looking to buy another computer. I have been looking at both the Atari ST and Amiga. For the life of me I cannot figure out which one to get. I will be using the computer for MIDI stuff; sequencing, patch editing and music software development. I know the ST has the MIDI port built in and has more support, but is it really a better machine? I am attracted to the Amiga because of it's multi-tasking operating system, but at the same time the ST is a lower cost machine (I think). Any suggestions for a MIDI nut ?

>
Not true! The Mark Williams library DOES use the environment scheme
for system()... It calls up the shell, msh.prg, and msh calls up the
command. If you are getting truncated command lines, something is
screwing around with the "ARGV" or "IOVECT" environment string and
the runtime startup is not finding the parameters in the environment.

If you know were the file you wish to execute is, you can
use "execve", this leaves out the overhead of an extra copy of the shell.
This also assumes that you have expanded any wildcards yourself and
don't intend to use any built-in shell commands. The version of
"make" used in the MWC package uses the library "system" call, and
I have made libc.a from that make with one gigantic list of object modules
(well over 200 files).

>I am using the modified version of the 'make' program posted to this
>group some time ago. Some of my makefiles want to pass long argument
>lists (usually on the step linking together a program). The argument
>list gets chopped off at 127 characters, which is somewhat annoying.

If there is enough demand, I will post a "micro-msh" that I use on
520 STs from Make which does no wildcards or built-ins, and calls up
msh for anything it can't find (or if it detects a wild-card), but
it is really ugly (read "bad") code, and I'll want to fix it up.
This could be turned into a "system" subroutine that has some more
brains.

202. MWC questions

Newsgroup: comp.sys.atari.st
Date: 1987-11-17 20:28:45 UTC
From: dinolt@wdl1.UUCP
Message-ID: <4120002@wdl1.UUCP>
Source record: 256002

I recently, last weekend, broke down and bought a "real C compiler" for my 1040 ST. I purchased the Mark Williams compiler since it seemed to be getting the most use and best reviews on the net. The documentation organization takes a little getting used to but all and in I only have found two problems I haven't been able to deal with.

The first is very strange. I have a BMS hard disk which includes a battery backed clock. As part of my bootup process, I run a program called setclock (in the auto folder) which sets the system clock to the "correct" date and time. The GULAM shell, the file system dates and other programs all have a realistic notion of the time after boot. MSH (the shell supplied with MW Compiler) is completely confused about the time. (MSH thinks the date is in the 21st century on a consistent basis). I thought that maybe it was getting its idea of the current time from the keyboard clock since that survives resets, so I wrote a program to transfer the system time to the keyboard time. I ran this program before I used the MSH date function. That had no effect. I am very confused. Anyone have any other ideas?

The second problem involves the MAKE program supplied with the MWC compiler. If I run MAKE under MSH everthing works like a champ. If I run MAKE under the GULAM shell (lattest distribution from comp.binaries.atari.st, thanks Turner et al) I get the message

Shell not found

after make prints out the cc command line it is planning to execute. When I run the MAKE program with the -d option, all the all the environment variables seem to be set correctly, including SHELL=d:\bin\msh.prg

The CC command itself works fine under GULAM. A version of the public domain program MAKE which was on the net a few months ago also works fine under both SHELLs. The other bit of evidence I have is that when I run XPROLOG, posted in comp.binaries.atari.st I found exactly the same symptoms. XPROLOG could not find the SHELL when running under GULAM but could find the SHELL when running under MSH.

Obviously something is wrong with my environment, but I haven't been able to figure it out yet. Anybody have any ideas?

Please send responses to me and I will post if there is sufficient interest.

George Dinolt (dinolt@ford-wdl1.arpa, ...!sun!ford-wdl1!dinolt)

The EAB cable is for the 520. They had a box in their catalog
designed to work in conjunction with the 1040 and this cable. I talked
to them and they still hope to have the box but the current version doesn't
work.
No date on when it will.

206. Modification/Fix for tgetent.c in TERMCAP.ARC (posted earlier)

Newsgroup: comp.sys.atari.st
Date: 1987-11-17 23:37:35 UTC
From: dag@chinet.UUCP
Message-ID: <1850@chinet.UUCP>
Source record: 256006

I have made a few minor modifications to the file "tgetent.c" from the recently posted termcap library for the ST. One of these changes permits the use of fully qualified paths in the environment variable "TERMCAP", thus "c:\etc\termcap" could be used, the old version required that the file name be prefixed by a "\" or "/", thus devices were not allowed. That change should work with any compiler, and is conditionalized under the symbol "GEMDOS". The other changes add a search along the library search path (LIBPATH) for the termcap file, and uses the function "path" from the Mark Williams C library (version 2.0 and later). These changes are conditionalized under the symbol "MWC", which must be defined on the compilation command line if you want the feature to be used.

Here is an edited "diff" of the files. No lines were deleted, just added. I hope you find these changes useful.

```
94 a 95,99
#ifdef MWC
#include <path.h> /* path search stuff */
#define DEFAULT_ROOT "termcap" /* name without path component */
#define DEFAULT_FILE "termcap"
#else
==============================
95 a 101
#endif
==============================
227 a 234,236
#ifdef MWC
char *pp; /* path pointer... */
#endif
==============================
230 a 240,242
#ifdef GEMDOS
if (*cp == '\\' || *(cp+2) == ':') { /* Improved recog. */
#else
==============================
231 a 244
#endif
==============================
254 a 268,274
#ifdef MWC
if ((pp = getenv("LIBPATH")) == NULL) /* Get the library path */
pp = DEFLIBPATH; /* if none, use default */
if ((pp = path(pp, DEFAULT_ROOT, 4)) == NULL)
pp = DEFAULT_FILE; /* Find the file */
return (fopen(pp, "r")); /* Open the file */
```

```
#else
============================
255 a 276
#endif
============================

Note: If you copy this posting into a file on your ST along with the source
for tgetent.c from the original posting, and you have the version of
micro emacs from the 2.* version of MWC, you can use the "error buffer"
feature of the editor to speed incorporating these changes.
At the shell prompt, type "me tgetent.c -e <file>" where <file> is the
name of the file containing this posting. This will bring the editor
up with tgetent.c in a large window and this posting in a small window,
and the cursor on the first line in tgetent.c where a change should be
added. Move the cursor down to the next line and insert the lines that
follow the line numbers up until the "============================",
then hit ^X followed by >, which should move you to the next diff.
You will probably want to shrink the tgetent.c window so you can see
all of each change without messing up the dot position in the error buffer.

You could also simply print this out and use the <esc>-G "goto-line"
command (don't use ^X-g, since this uses line-in-buffer rather than
line-from-file") to go to each line to append to.
(only in MWC derived versions of me).

208. Interest in a usenet supported graphics standard ?

Newsgroup: comp.sys.atari.st
Date: 1987-11-18 01:00:11 UTC
From: mgardi@watdcsu.UUCP
Message-ID: <4130@watdcsu.waterloo.edu>
Source record: 256008

I have logged onto CompuServe a couple of times lately, and they are all excited about a bit-map graphics standard they have developed called 'GIF' (Pronounced 'Jif') The acronym stands for 'Graphics Interchange Format' (surprisingly enough). GIF allows for full-color bitmaps, up to 16,000 bits square. Color values are given in terms of standard RGB values.

Anyway, would the net as a whole be interested in adopting a standard such as GIF, which would allow a wide variety of graphics hardware access to a large supply of bitmap pictures, clip-art, etc. ?

CompuServe have GIF decoders/encoders for IBM (cga/ega/vga), Macintosh, Amiga, Atari ST, and possibly others.

One of the advantages of the GIF standard is that it uses a type of Lempel-Ziv compression, typical compression of a standard ST 32k picture results in a 10k file -- not too bad.

In an effort to establish GIF as a standard, CompuServe says that the format is public domain, and that they are providing assistance to some 50 third-party software developers to get the ball rolling. They also say that they will be providing stock performance charts, weather maps, NASA photos, etc by the end of the year.

If people are interested, I can post what I know about the format. Note that I am not necessarily proposing that the net adopts 'GIF' -- I'm sure that there are other formats that merit attention.

Just a thought,

David Rowley -- Mutual Life of Canada -- Waterloo, Ontario

Source record: 256009

I have a fairly recent version of the DC Formatter and overall it's a nice job. I *really appreciate* the ability to lay down an MS-DOS boot sector! It makes the ST much less irritating when I'm trying to move files around for various people.

The only thing that I find annoying about the program is that they still muck up the screen and leave their blue desktop on exit. If they could just retain my colors so that my colors are restored on exit I'd be much happier. No, I don't use the putrid Atari green desktop. I have my colors completely re-arranged (white letters on royal blue background with dark grey desktop).

> trick with Fdelete first. But at present I see no need for that.
>
> Roland Waldi

The Fcreate() problem is a difficult one to pin down. I'm still not sure what the exact cause is. In the version of MicroEMACS that I modified, the Fcreate() function was used to create the output file (presumably overwriting any existing file). Occasionally it would create two files with the same name in a single directory. Several other ST owners that I know have reported similar problems, by not frequently. The problem seems to occur more with smaller files (< 1K), like shell scripts. To avoid this problem, I implemented a creat() call in dLibs which always deletes the file before creating it, as shown by the source code I posted. Since Fdelete() is relatively quick and Fcreat() is quite slow, the extra time spent deleting the file is hardly noticed. If anyone knows anything more about this problem, I'd like to hear about it.

Does somebody out there know how to play 8-bit PCM sound files through
the ST sound-chip ? As far as I know programs like STARGLIDER do it.
Who offers help ?

Henk van der Griendt (use my name in SUBJECT:, we share one username)

May be true only iff: your link is 8bit from your ST to UN*X.
And you lose all checking upon what you transfert.
(I have experimented here a case where Kermit is transfering garbage
and not telling it!!!. On Un*x the latest CKermit 4E(067) on the ST the
Uniterm 1.8a, in at least one case of 'set terminal parity' the transfert
is wrong, and Kermit does not know about it!!!)

>surrounded by News garbage, they have to be fitted together as described

All true uudecode just dont care about mail/news garbage, it is therefor
useless to remove it. (This is in uuencode/uudecode specifications!)

>above. The editor method gets pretty tiring when you get 11 part archivs!!

>now run uudecode on ``x.uue''. This works like a charm, and saves much
>editing!!
>-
>Paul Close paul@cacilj.CTS.COM ...!{uunet, crash}!cacilj!paul

What if you do not have a Un*x ?

The 'table' 'begin' 'include' ... lines are precisely lines to allows
you to avoid all unecessary editing, with the correct uudecode you
will just double click / invoke uudecode on the first file, and
all chaining and checking will be automatically done. No sweat.
(If it was uuencoded with uue.ttp, not some archeological item)

BTW the character translation is not done on BITNET, it is some kind
of brain-damaged gateways that are the problem, and uud.ttp is
taking care of most of it anyway. (I said uud.ttp, not uudecode.* ...)

uud.ttp and uue.ttp are available at all good places.
(arced/uuencoded or .hex if you are still naked)

> How they do it? I do'nt have the slightest idea.
>
> Ryko Prins

Yes, how do they do that? I'm quite sure the ST can really only display
512 colours, maximum, as that is directly related to the number of
bits from the shifter feeding the D/A converters which feed the RGB
outputs. (3 bits for each colour = 8 levels of each colour. 8 x 8 x 8
gives 512 colours. Period.) I wonder if this program, and another I saw
with similar claims, are trying to claim that a region of the screen
with mixed pixel colours is really a new colour. If so, Spectrum 512
could make similar claims. Any program that can use all 512 colours
in a single picture could claim that, right? But, I'd rather they
didn't. Let's just talk about the number of colours any one pixel
can be, and keep these claims reasonable.

From: exodus@uop.EDU
Message-ID: <763@uop.EDU>
Source record: 256017

Following are my changes to Fred Fish'd now-public-domain debugging macro package. It fixes a few problems and adds support for the profiling timing stuff. Also, to compile dbug, have a getopts library ready. I used the getopt code from mkprog, posted to comp.sources a while ago (last year?). [Use Mark William's C Compiler, know what you are doing. Make the getopt library first with 'ar rs libopts.a getopt.o ...' then compile dbug.o with that library included on the command line ('-lopts'). Be sure to define ATARI when compiling '-DATARI'.

Make the dbug library with 'ar rs libdbug.a dbug.o'. Then compile analyze.c with the '-f' floating pt option, the dbug library '-ldbug' and '-lopts'. Yes, a lot of work, eh? I should've just written a new makefile.]

Message-ID: <568@aucs.UUCP>
Source record: 256018

Keywords:Mega blitter

I am wondering if the Megas in the US are being shipped with the blitter chips in them, up here in Canada the Megas are being shipped without the blitters and four of the new ROM chips. We did have a Mega4 at the shop with the blitter installed, but when we Questioned Atari Canada, they said that the only reason we had one was because it was to be our demo unit?????
I do have a Mega 2 on order, but I was told that I will be waiting until Jan. 88 before I get my blitter(what a piss off, go Atari go). We have also found 6 programs that will not work on the Megas(mostly games, I will get a list and post them), they are all using copy protection??????
If I get anymore news, I will post it to the Net.

223. Daisy chaining SH204's

Newsgroup: comp.sys.atari.st
Date: 1987-11-19 03:05:25 UTC
From: 870646c@aucs.UUCP
Message-ID: <570@aucs.UUCP>
Source record: 256023

Keywords:SH204

I have a general question for all of the hackers out there, "Can you chain together the SH204 drives by installing an extra DMA socket on the back of the case, providing that you wire it pin to pin with the present socket?". I know that you can select which DMA device the drive is by setting the dip switches inside. It just seems like common sense to be able to this, but since when do common sense and computers mix?

I am not a MIDI expert by any means, but I do know the ST pretty good. All
I can do is pass on what I and alot of other ST owners have learned. The ST
is a very good computer, the support for the MIDI port is very good, I know
that there is several very good software packages out for it, and most of
them do not but "copy protection" in your way if you decide to use a hard disk
like myself. You must remember that if you do get the "Amiba" you will have
to dish out the extra bucks for the MIDI interface(if they have one??).
Give the ST a look over, as ol'Jack says "Power without the Price".
Also it is a known fact that the ST is by far more supported than the Amiga.
Give the Amiga a look over as well, it is a nice machine.

P.S. Good luck with whatever machine you by!!

225. New ROMs

Newsgroup: comp.sys.atari.st
Date: 1987-11-19 13:24:18 UTC
From: SOFPJF@UOGUELPH.BITNET
Message-ID: <8711191403.AA20847@ucbvax.Berkeley.EDU>
Source record: 256025

I went to the Canadian Computer Show earlier this week (a sort of mini-COMDEX), and asked about the availability (to the general public!) of the BLIT and the new ROMs as a retrofit to the 1040/520. No one at the Atari booth knew anything at all. All I could get was "Only the boys in California know for sure". Some version of the BLIT was out at least a year ago (I saw one at the same show LAST year).

So how about it, Mr.s Harris, Pratt, et. al? Are the BLIT and the new ROMs going to be available for us non-developers, and if so, when?

Also (speaking of upgrades), why do the non-solder memory upgrade boards come from everyone else BUT Atari? I know, they want us to buy Megas, but gee, even IBM sells you extra memory for their mainframes, if that's what you want to do (instead up upgrading the CPU).

Grounding DTACK would cause your ST to stop working. I don't think it
would generate any smoke, but the 68000 would no longer be able to get to
memory or some I/O locations reliably.

I'd say it doesn't matter; you'll be happy with either. I use my machine for MIDI applications; after having it for two years a very good friend of mine went out and bought the other system you mentioned, and he's happy with his purchase.

Computers owners can get pretty huffy when they try to defend their purchases (as I suppose synth owners can too); so ignore any specific machine bashing; pick up a few magazines on each machine, see what kind of support each one seems to be getting (musically), look at the music software packages out for the machines, look at the prices you can get (visit some dealers, but don't let them tell you the BAD things about the other machine, just the GOOD things about theirs ... they often don't know the facts about the other machines).

Then make a purchase, or don't. But I personally don't think you'll lose no matter which machine you buy. They are both very capable machines for synthesis and MIDI control.

I have my Amiga hooked up to a MIDI keyboard and it works very well.
I would assume that it would work even better if I had better software.
I am using Deluxe Music Construction Set, but I heard the Pro-MIDI-Studio
is much better. I bought an Amiga, so I believe that it is a better computer
and preferable if you will be doing things other than MIDI, but for MIDI only
applications, the ST is better. It is also less expensive, a lot less if you
get the monochrome monitor, and has a MIDI-port built in. MIDI ports for the
Amiga are around $50.00 (Although we built ours for $20.00).
One other thing. Just yesterday I was flipping through Keyboard magazine
and noticed several adds for ST MIDI software. There was only one for the
Amiga: Music X. I can't say this for sure, but there is probably more MIDI
software for the ST.

Final word: Buy the ST if you really only want it for MIDI. Buy the Amiga
if you want to use it for other purposes and/or if you want
good sound to come from the computer also. (Pretty useful)

Source record: 256046

This might be a dumb question, but I plead ignorance about what is involved in modifying computer equipment so here goes:

I have an apple IIc (yes, I know, you pity me) with an extra disk drive. This drive is probably THE most quiet drive in the world. It's a Super 5 drive, model C-40. I'm planning on buying an Atari Mega ST (good move) and I was hoping to modify the extra drive to work on my Mega--any suggestions (or bets about whether it will work)?

237. DCLOCK?

Newsgroup: comp.sys.atari.st
Date: 1987-11-19 21:56:00 UTC
From: JEMCCABE@MTUS5.BITNET.UUCP
Message-ID: <8711210004.AA07411@ucbvax.Berkeley.EDU>
Source record: 256036

Date: 19 November 1987, 16:52:05 EST
From: Jim McCabe JEMCCABE at MTUS5
To: INFO-ATARI16 at SCORE.STANFORD.EDU
Subject: DCLOCK?

A few days ago, I asked for help on setting and reading the keyboard's internal clock. Someone was very nice and responded by telling me that a program is out there in netland that is written in Personal Pascal (the language I am also using) called DCLOCK. Apparently, I can get the sources for this program.

After a little search, I have found a program called DCCLOCK but I don't know if it comes with source code.

Unfortunately, I have lost the address of the person who responded to my original request.

Can that person please send me the source code directly? I would really appreciate it! (Or at least send me a note telling me where I might be able to find the sources.)

Thanks!

Jim McCabe

>commands [rx and sx] do?

They allow you to upload or download files via xmodem. The 'rx_remote_cmd' and
'sz_remote_cmd' options can be set; the GULAM.G file as distributed sets
these parameters to work with Chuck Forsberg's rz/sz package.

>2) From ue (emacs) when you type a ^K is 'temporarily' pops you into Gulam
>and your editing buffers are not FREED. [..] Is there a more direct way to
>return to your editing after doing a ^z

Type 'fg' from the gulam prompt.

>3) Finally, in ue, if you do several delete-backward-words (M-BS) then do
>a yank (^Y) your deletes will be restored in reverse order. [..]

So, delete it in the right direction.

>How does one get to atari-sources to find out what is there and to ultimately
>upload or download (correct terminology?) something to/from them or is it
>only a part of netnews.

It's a part of netnews, although certain people (like myself) keep archives.
Mine are available via anonymous UUCP; there MIGHT be one that's ftp'able out
there.

I believe it's the last section of the manual Atari distributes with the
SH204 that tells how to do this. The answer is 'Yes, it can be done!', but
I don't know the specifics. There are some pretty decent docs on how to
do this with the Supra drives, are the specifics the same?

> The Fcreate() problem is a difficult one to pin down.

Yes.

> Occasionally it would create two files
> with the same name in a single directory.

I found out why: in GEMDOS, Fcreate calls Fdelete, but doesn't check to see if the delete actually worked. If the delete fails for some reason, Fcreate doesn't notice, and creates another file by the same name.

> I implemented a creat() call in dLibs which always
> deletes the file before creating it[.]

This won't help, because if Fcreate's call to Fdelete fails, yours will too.

> Since Fdelete() is relatively quick and Fcreat() is quite slow [...]

Fcreate is not slow. The first write to the file after Fcreate is slow. This is because the code which looks for the first free cluster on the device is slow. This is especially noticable for large, nearly-full devices. We are addressing this problem.

Now here's the tricky part: Fdelete (as called from outside GEMDOS or within it, like from Fcreate) checks to see if anybody has the file open. If the current process has the file open, Fdelete closes it before deleting it. If some OTHER process has the file open, Fdelete returns EACCDN ("access denied"). This seems to be what is happening, but I can't figure out why, because nobody else has the file open!

I can always reproduce this problem. Here's how:

```
Proc1:
------
Fcreate ("file1",0);
Fcreate ("file2",0);
Pexec(4,"Proc2",0L,0L);

Proc2:
------
Fdelete("file1",0);
/* returns EACCDN: Proc1 has file open */

Fcreate("file2",0);
/* works, even though it should fail */

Pterm0();
Pterm0();
```

Now there are two copies of "file2" in the current directory, even though the failed Fdelete of "file1" in Proc2 shows that GEMDOS is checking for file ownership.

I can't figure out why this happens in Emacs so much, but it happens. If you fix Fcreate so it does check the return code from Fdelete and returns EACCDN, Emacs will tell you it can't open the file for writing. This is more correct behavior than creating two files, but still doesn't explain why Fdelete thinks somebody else has the file open when nobody else does.

>Yes, how do they do that? I'm quite sure the ST can really only display
>512 colours, maximum, as that is directly related to the number of

I think that if if can be done, It would be tough on the processor.
One possibility is that it was a typo and they were referring to the
Amiga version. Or it can actually display more than the maximum number
of possible colors.
How? I read of a demo in an old Antic of how two pages of graphics were
switched between screen refreshes so that one location on the screen
would be forced to display two pixels with different colors, producing
a third color (albeit with flicker ala Amiga interlace mode). So showing
a red and blue pixel in one spot would produce purple. I know of two games
which do this. On the Atari XE/Ls, a game called _Tail_of_the_Beta_Lyrae_
by Datamost had a title screen that had the top 1/5 of the screen done this
way. The title, which appeared translucent, scrolled over the background;
and get this, It loaded the game as it did this! On a 1.79MHZ machine
that has slooowwww drives. Wow! (price, $7 at kaybee)
Some arcade games also do this. I know that on "Bermuda Triangle",
"Gondomania" and others like it from Taito, this is done to produce
shadows of flying objects. (because you can "see through" them.)

I suspect that Eidersoft is using this, or a similar method, in combination
with the method used for spectrum 512. Alone the screen switching
method can get you 256 colors (16x16). With some spectrum like method
in combination, more should be possible.

The screen switching method is not nice to look at after a while because
of the flicker. It should look nicer on a high persistence monitor, and
even better on a photo. So see the product "live" before you buy it
to see how it looks.

Me, I have a mono monitor and I'm waiting for an rf converter box.
Still waiting for color prices to drop a little.

> /PJ

I think they'll start selling RAM when they start selling machines that they _MUST_ support properly, namely business machines (and I don't mean PC clones, I mean ones you and I can't afford). Face it, atari is giving shitty after sales support because they know most of the people who bought an ST can't afford to get another system. Besides, there is a larger profit margin in sales. How many imes have you had your machine die.

Besides, would you, as a computer company, sell RAM if you knew others would be selling possibly better products for less.

And on the subject of RAM, what's the best 4meg upgrade for a 1040st? And does someone know how to modify the ST so it has an exposed bus like the Megas?

>that everything runs slightly downhill from left to right.

You can adjust the tilt, by rotating the yoke that is on the
picture tube, and resides on the neck and the base of the tube. Sounds
like all you have to do is loosen a holding screw and then gently turn the
yoke until the picture is straight.

The picture can be enlarged by adjusting the Verticle lin and
the Vert Height adjustments inside the monitor. Be aware that you will
loose some resolution in doing this, and I myself have opted to leave it
as it came from Atari. I love the rez.

Also be aware that the inside of the monitor is colted with a
material that IS CONDUCTIVE, and therefore if you do not unplug the speaker
and remove the back totally, you can have the possibiities of shorting the
monitor out, and thus costing repairs.

Also be aware that there is HIGH VOLTAGE inside the monitor, and that
the CRT can retain a charge, thus causing an shock hazard.

If you are in doubt, have some one that is more at home inside the
monitor for you can avoid problems. If in doubt DON'T DO IT YOURSELF, get
someone that has done this before, or has worked on Television sets, as they
would be much more aquainted with what to do.

>--
>Mar Tan
>GE Fanuc
>Charlottesville, VA

I read a review in Keyboard magazine that compared several micros for midi.
At that time(about 2 months ago) the author felt the best midi micro was
the Mac and the ST would probably become the Micro Midi of choice because
of cost and cability. The author also wrote he was disappointed
with his Amiga midi performance. The Amiga multi-tasking seems to interfer
with the sequencing time stamp accuracy.

I do not own an Amiga and I do not have midi experience. I am only
interpreting what I read. Perhaps you can ask an Amiga owner.

Also, I have heard that Keyboard magazine advertisements
contain more ST's then any other micro.

Now, let's satisfy RN.

From: mj@myrias.UUCP
Message-ID: <538@myrias.UUCP>
Source record: 255853

Recently posted "dcclck31.prg"a from Mike Vederman - "Double
Click Software" - is still buggy. It does not return memory to OS.
After every invocation it creates 300+ bytes of dead memory. And, when
deinstalled, it does not return its memory at all. To see it for
yourself - create a sizeable ram drive, in order not to wait too long -
and click a number of times on "dcclck31.prg". Rather soon you will
see "out of memory" message, and your only way out will be to reboot.
You should be ok, if you just install the clock and will not touch
it anymore. But still it will gobble down a quite sizeable memory
chunk.
This may be a bug in our belowed TOS (boo!!!) and maybe it
disappeared with a new version. I cannot check. A behaviour
described was observed on a plain old 1040 ST.

Source record: 255854

I haven't been paying attention to this list long, so please excuse me if the information I want has gone by before.

I'd like to hear about what y'all think of the various C compilers currently available for the ST. Pros, cons, bugs, availability of upgrades, cost, versatility, speed, efficiency of generated code, whatever. My motive, obviously, is trying to decide what one to get for my ST. My primary concern is not to do development in C, but to be able to port in other C code from other random places, so versatility is probably my primary criterion of interest, though I'd still like to hear about other stuff. I'll be happy to post the results of the survey if anyone's interested.

On another topic, does anyone know how to get the calendar/clock in the beast to remember its time thru power-downs? I can't believe it's suppsoed to work that way, but I can't find any way to make it remember. What simple solution have I overlooked?

Finally, what's a good source of info on how the hardware and software guts of the ST work?

Thanks in advance for any info.

255. Extended Argument Passing Proposal

Newsgroup: comp.sys.atari.st
Date: 1987-11-20 21:59:24 UTC
From: apratt@atari.UUCP
Message-ID: <891@atari.UUCP>
Source record: 255855

Dale Schumacher et al. have been working on an improved argument-passing protocol for GEMDOS. This is their manifesto. They consulted me (and, I confess, bent to my will) about which of many methods to use. The one below gets the job done cleanly and is easy to understand and implement. It doesn't do anything with interrupts, and doesn't use Pexec(load/nogo), because that doesn't work. The only "rule" this idea breaks is that it has the child reading from the parent's data space, and on the ST that is no big deal.

This is an important topic because the Mark Williams trick of passing ARGV in the environment is incomplete and messy. It is incomplete because you can't tell if the ARGV came from your parent or from a higher ancestor with intervening shells that don't know about ARGV. It is messy because it hauls all the command line arguments around in the environment, involving lots of copying.

Here is the proposal. I recommend discussion and eventual adoption of it. Note that mail should go to ...stag!syntel!dal, not to me. I'm afraid I don't have time to follow up on this as closely as I might like. Note that this is not Atari Official anything: I am posting this because I am interested in developing a better standard, and to lend an air of importance to the whole affair.

A STANDARD FOR EXTENDED ARGUMENT PASSING IN 'C'.
by
David Parsons
Dale Schumacher
John Stanley

Why change argc/argv in the first place? Well, there are times where (a) it would be nice to have more than 128 bytes of command-line arguments, (b) it would be nice to pass arguments to a child process without having the startup code in the child process retokenize (spaces inside of an argument, tokens containing `>', `<', `*', and `?', etc.) and (c) it's nice to have a more Un*x-like interface for argc/argv.

The method employed by Mark Williams involves making a mess of the already confused environment string, and lacks validation that the ARGV string did, in fact come from a process's parent. We would like to suggest a cleaner way of handling extended arguments. Of course, the normal command line image will have to be supported for programs which don't understand the extended format, and the extended format must be

validated in some way, but these are fairly trivial problems.

We would prefer the following approach. An environment variable
called "xArg" is placed in the environment. The value of this variable
is 8 hexadecimal digits (0-9 and capital letters A-F). This value
defines the address of the XARG structure in the parent's data space.
The XARG structure is defined as:

```
typedef struct
{
char xarg_magic[4]; /* verification value "xArg" */
int xargc; /* argc */
char **xargv; /* argv */
char *xiovector; /* i/o handle status */
char *xparent; /* pointer to parent's basepage */
}
XARG;
```

<xarg_magic> value is the constant "xArg" ($78417267), and serves to
validate the extended argument format.
<xargc> holds the normal <argc> value.
<xargv> is a pointer into the parent's data space where the list of
argv[] argument pointers is stored. Even though <argc> is available,
argv[argc] should be set to NULL to tie off the argument list. Obviously,
the <argv> values would also reside in the parent's data space, and should
be copied by the child process as part of the startup procedure.
<xiovector> points to a '\0' terminated string which describes the
state of the i/o handles. Only the characters [CAPF?] are valid in the
<xiovector> string. These represent [C]onsole, [A]ux port, [P]rinter,
[F]ile and [?]unknown. This feature is used to allow easy implmentation
of an isatty() function. To support this feature, creat(), open(), close(),
dup() and dup2() [aka: Fdup()/Fforce()] must maintain the values in the
iovector[] string.
<xparent> points to the basepage of the process which set up this
XARG structure. If this value is not the same as the <p_parent> pointer
in the current (child process) basepage, then the extended arguments are
not for the current process, but were passed along by a shell/program
which was ignorant of this argument passing scheme.

The following source code is public domain and serves as a guide to
use of this extended argument passing method...

```
/*--------------------------------CUT--HERE-------------------------------*/
#include <stdio.h>
#include <osbind.h>
#include <string.h>
#include <basepage.h>

typedef struct
{
char xarg_magic[4]; /* verification value "xArg" */
int xargc; /* argc */
```

}
/*--------------------------------CUT--HERE-------------------------------*/
```

The creat()..isatty() functions work like their Un*x counterparts.
Watch particularly the parameter order on dup2(). The lspawn() and
_initargs() functions implement the heart of the extended argument passing.

lspawn() is patterned after the standard function execl(). It takes
a program name as its first argument, followed by a variable length list
of parameters ending in a NULL parameter, ie:

```
rv = lspawn("grep", "grep", "foo", "foo.bar", NULL);
```

Notice that, by convention, the name of the program to be executed is
passed at the first argument, which becomes argv[0]. lspawn() returns
the exits status of the child process, or a TOS error code. Since exit
status values are limited to a 16-bit word, they can only be word negative,
but TOS error codes will always be long negative.

From: exodus@uop.EDU
Message-ID: <775@uop.EDU>
Source record: 255856

I wouldn't recommend buying another SH204...buy a 40 meg ST506 compatible drive cheap from a mail-order house or so, make or buy the ribbon cables.. and add the drive to the existing adaptec 4000 controller already in the SH204..... Save some money and get a lot more storage out of it!!

Source record: 255857

How they do it ? I don't know.
What's my guess, given the constraints of the hardware (and there isn't much in there except some RAM, a 68000 and the SHIFTER) ?

Allright usually on my old and beloved 800 everyone used DLIs (now in ST-Talk that's called HBLs) for multiple colors. An interrupt occured after (*) a scanline. And one had the time to change color registers, in perfect synch with the display.
But this really isn't neccessary.
You don't have to switch colors on scanlines. You can switch them anytime you wan't. (True for ST and 800)

Problem is that you need to get the CPU somehow in sync, with the display. This was impossible (?(*)) if you have a co-processor stealing cycles (as ANTIC does) but the SHIFTER doesn't and this makes things easier for the ST.

From previous postings (I have never seen the actual product, much less a picture) I read that only 199 lines can be shown with SPECTRUM 512.
My guess is that the first DLI (Ooops HBL) is used for starting synchronization. Then the CPU will spring into action, kerchunking away, changing registers on the fly. Here is where above mentiones RAM comes into the picture. Displays with 300/200/9? Bits are BIG.

So I think this is a theory that would work in praxis, I would be very surprised if SPECTRUM 512 wouldn't work that way. (Surprise me !)

(*) Not really after, somewhere in the middle of the scanline.
(**) Footnote : I managed once to get a somewhat appealing display giving the ANTIC some cycles, but usually it's just a mess.

>.......MSH thinks the date is in the 21st century........

Our configurations are similar - I run BMS hard disks off of a 1MB 520.
The MWC file \bin\profile may be setting your TZ environment variable to
a value which produces this result. Additionally, the line which reads
" date `date -i` " in the released \bin\profile is setting the system
clock from the IKBD clock, and may be the culprit. I would suggest the
following boot sequence:
1) bms disk driver
2) setclock
3) your program which reformats and copies sysclock to IKBD clock
last) foldrxxx/gemboot combination to fix 40-folder problem.

>If I run MAKE under the GULAM shell (lattest distribution from
>comp.binaries.atari.st, thanks Turner et al) I get the message
>
>Shell not found

I am not certain, but a first guess is that GULAM and MSH use different
techniques for passing command-line variables which are not compatible.
Second guess would be that the MWC make is looking for a pointer in
it's environment in order to find an entry point for a shell routine to
receive a command line to execute. Check the MWC 2.0 release document (not the
lexicon, but the pamphlet) for a ciscussion of compatibility issues with other shells
(like Beckmeyer).

>that I have seen require the 128K ROMs.

This is true, however, David Small is reportedly working on adding features
of the newer ROMS. Also, there is a lot of Mac software which still runs on
those poor outdated 64K ROMs.

>Also, if I am not mistaken, there is
>no way to interchange disks between the two machines (read Mac disks in an ST
>or read ST disks in a Mac), this really isn't a viable alternative.

Not true. Data Pacific just released the Translator One, a box which plugs
into the ST's MIDI ports and somehow modulates the signals coming from the
normal ST drive so that the emulator thinks they are coming from an odd Mac
drive (I have more trouble with Mac drives on Cornell's public Macs than any
other computer system we have percentage-wise, though I heard the C-64 had a
similar problem). The only problem is that it only currently allows MFS
(though double-sided) disks. Again, Small is working on getting it to
support HFS.

>I was also
>under the impression that the speed difference was related to the Mac's
>handling of the video display (a problem which the SE and some third party
>RAM upgrades, most notably the MonsterMac, don't have).

That wasn't what I heard, but since I don't know I won't comment.

>> Marty
>Robert Hammen Computer Applications, Inc. hammen@csd4.milw.wisc.edu

In general, I would say that the Magic Sac makes sense for some people,
namely those who don't need a Mac exclusively (emulation is never as good),
those who are strapped for funds yet want use of some Mac products, and
those who want a faster Mac with a bigger screen for less money, despite all
the problems with an emulator. It also makes a lot sense for those who
already happen to own an ST and can't afford another computer. It certainly
will never replace or probably even compete much with a Mac. But it is
still a wonderful hack!

260. Atari ST, Mac emulator and TOPS network

Newsgroup: comp.sys.atari.st
Date: 1987-11-21 03:13:14 UTC
From: woslyng@arc.CDN
Message-ID: <441*woslyng@arc.cdn>
Source record: 255860

Is is possible to connect an Atari 520 or 1040ST running a Macintosh emulator (such as Magic Sac) to a TOPS network?

Macs are connected to the TOPS network through the serial port. One problem is Macs have a special chip to drive the serial port at 230K baud. Also, the custom chip may be doing more than just driving the port at high speed. If you have tried an Atari ST on TOPS or have an opinion to express, please reply to either info-atari16 or directly to me. Thanks.

> Can anybody help?

Most floppy drives have a strobe disk on the motor drive. To check the
speed you need to strobe it with 60HZ. A neon bulb will do the trick.
Either get an NE-2 and resistor and plug it in or get one of those
$.49 elcetrical testers which is a neon bulb in a plasicc case, plug
it in tio the ac line and hold it next to the strobe disk.

> HEY everybody, correct me if I'm wrong (hope I am.).
^^^^^^^^^

Don't worry, you are. Barry Comer is talking about daisy-chaining SH204's, not the Tandon drives that come inside the SH204. It is possible to daisy-chain up to 8 of the SH204 by chaning the SCSI address of each. (A 3-switch dipswitch == 2^3 combinations = 8). Just make the right cables and away you go....

But you did have the right idea... you add another physical drive inside (well, to the internal controller anyways...be kinda hard to shove another drive into that cabinet.) the SH204..the Adaptec 4000 _can_ support two hard drives.

[line-eater] [line-eater] oops!

Here's a possible solution to the Fcreate() bug. It remains
for Netlanders to tell me if it works, as my hard disk is
kaput right now, and I'm not sure where my C compiler is
on floppy.

Before creating a file, use Fopen() to read it. If you can read it,
it exists. Then, just overwrite it with Fwrite(). If it does not
exist, use Fcreate(). The problem is, will Fopen() suffer the same
problem as Fdelete()?

I believe someone mentioned recently that they purchased the
Spectrum 512 program? Could this same person please comment
on whether there is any appreciable slowing of the machine?
I've played with DEGAS Elite somewhat, and even that's a little
slow at times. If Spectrum indeed has most of DEGAS's features,
as the ad claims, then is it also as slow, or slower?

265. UUPC: Answer to "How do I get it?" (UPDATED)

Newsgroup: comp.sys.atari.st
Date: 1987-11-21 10:01:09 UTC
From: skl@van-bc.UUCP
Message-ID: <1553@van-bc.UUCP>
Source record: 255865
Cross-posted to:
comp.mail.uucp,comp.sys.ibm.pc,comp.sys.mac,comp.sys.amiga,comp.sys.atari.st,comp.sources.wanted,comp.sources.d

In an attempt to answer this question before it continues to flood
in via e-mail, I will post the UUPC distribution information again.

Please note that some NEW information had been added to the end of
it since the last time this information was posted.

...Sam

****

UUPC can be obtained via direct anonymous uucp login at van-bc.UUCP.

Phone: 604-939-4782 Telebit Trailblazer @ 9600 baud, PEP/UUCP
spoof enabled, also handles 2400/1200 baud.
604-939-4756 This modem handles 2400/1200 baud only.
Login: nuucp
Passwd: nuucp

The UUPC files are in ~/uupc/*, and are stored in compress (.Z)
format.

An index of what's available is in the file ~/uupc/INDEX .

****

For those who can do ARPA FTP, the UUPC files are also available
from the UUNET archive at the Internet host uunet.uu.net:

The UUPC files are stored in uunet.uu.net:~ftp/uupc/*

****

Since the UUPC sources had been posted to comp.sources.misc in
August 1987, it is also archived in the various comp.sources.misc
archive sites around the net. As the procedure for obtaining
archvied postings from these archive sites varies, please contact
the archive site you intend to use for its retrieval instructions.

For those who are looking for such an archive site, the following
excrept from a recent USENET article might be useful.

Path: ...!uunet!steinmetz!ge-dab!codas!killer!billw

267. Anomality in GULAM (????)

Newsgroup: comp.sys.atari.st
Date: 1987-11-21 14:42:00 UTC
From: juancho@utcsri.UUCP
Message-ID: <5689@utcsri.UUCP>
Source record: 255867

I have started using Gulam beta and like it very much. I discovered what
I think is an anomality. If I set the path up as follows

set PATH = .,c:\bin,d:\bin,e:\bin,f:\bin,g:\bin

I would expect gulam to check . for the executable before any of the
specified bin files. As it is I have to do a rehash after a cd so that gulam
will find the correct file. I spend about an hour the other day trying to
fix a bug in a program, but could not get anywhere with the fixes as I
did not realize that I was running an older version of the executable.

The quickest way I have of fixing this is to alias cd to a shell
script that changes dir and then rehashes.

Apart from that no qualms with gulam.

Thanks.

Ps. Did anyone compare my vapourware release of the 3200 bs with the new
machine that atari is releasing? Which sounds more credible?

Okay, I'm not everybody, but I will take a stab at it.

****
*** You are wrong. ***
****

The floppy connection is limited to two drives, and though the data comes in through the DMA chip from the floppy, this is not the DMA port. The DMA port allows connection of a fairly large number of devices (8 or 16?)

I've spoken in the past with some people at Atari about connecting a second DMA device, and they said that the extender would have to be buffered since the DMA chip cannot handle much more load than the SH204 puts on it. I believe that several vendors now sell drives/controllers which have DMA daisy chain plug.

Include in this number ICD, from Rockford, IL. Maybe Supra now sells one, and I believe that even Atari has shown a drive with this feature.

You can, however, add a second drive to the controller inside the SH204. I don't have details right here.

a little background:

I have an Atari 1040ST, a monochrome monitor & I enjoy both.

Orginally Atari planned, and the schematics show, an internal RF modulator for the 1040. However they scrapped the RF modulator in the build for the 1040ST's (some 520ST's do have the RF modulator installed).

So, instead of having outputs of Composite, RF, RGB & high resolution mono, 1040 owners ended up with only RGB & high resolution mono. (the circuitry for Composite was part of the RF modulator).

I enjoy the mono for text processing, etc., however (when the little boy in me comes out) I like to play a game or two. Most of the games generated in the US are color only, so I'm out of luck.

Many owners of mono systems are unwilling (or at least extremely reluctant) to spend the bucks for a color monitor to play an occassional game, so I'm trying to come up with a means to provide composite or RF from the available signals.

FLAME ON! Please listen ATARI!!

I don't blame you for not putting in an RF Modulator in the 1040. If you wanted to reduce the cost of the machine, fine. If you thought that having as RF output made the 1040/520 more toy-like and this was not the image that you wanted for the machine, fine.

BUT, it sure would have been decent of you to give us a Composite signal out so that if we wanted
we could have bought a standard Composite to RF converter.

FLAME OFF! keep listening....

Neil, please answer me this, will the Modulator that came in some of the 520's work in the 1040's? Are the inputs/outputs the same? Looking at the schematic and the vacant place in my motherboard where the Modulator was planned to go in, it looks like it wouldn't be very difficult to install a 520 modulator (& the resistors etc. that there are empty holes for) if it's the same as originally intended for the 1040. Why not make the modulators a dealer installed option?

Heck Neil, even the guys/gals with color monitors would like to video tape stuff from their machines.....

If the 520 modulators won't work, and Atari doesn't want to market a modulator for the 1040ST, will you please at least tell us the best way

to go about hooking something up to give us Composite? It would be a great goodwill gesture.

And Neil, if you have any of those new ROMs that need a stress test, ship a set to 598 Concord Drive, Webster, NY 14580 and I'll test them in the cold weather for ya.

^^^^^^^^^^^

The Macintosh serial ports are driven by a standard Zilog 8530 SCC on the
motherboard. It was chosen probably because it has such high-speed capabilities.
The fact that the AppleTalk device drivers (TOPS runs on AppleTalk) and hardware
absolutely require this chip makes it unlikely you'll be able to do what you
want without extra hardware. Unless of course Atari ALSO uses said chip for
THEIR serial ports. Anyone know?

271. Datafree's Memory upgrade for Atari 520ST/STfm and 1040ST

Newsgroup: comp.sys.atari.st
Date: 1987-11-21 19:59:22 UTC
From: lharris@utgpu.UUCP
Message-ID: <1987Nov21.145922.4934@gpu.utcs.toronto.edu>
Source record: 255871
Cross-posted to: comp.newprod,comp.sys.atari.st

Datafree announces their 2.5/4 megabyte memory expansion board for the Atari 520ST, 520STfm and 1040ST computers.

Datafree's memory upgrade board for the Atari ST computer expands memory space to either 2.5 or 4 megabytes. It consists of a memory plane that interfaces via a plug-in adaptor board and a template that requires only 18 solder connections to the MMU.

Quality multi-layer circuit board construction ensures noise free operation with 120ns 1 megabit dynamic ram from any manufacturer.

It has been tested in all revisions of 520ST, 520STfm and 1040ST and is compatible with both TOS for the 520/1040 series and the new blitter compatible Mega ST TOS roms.

FEATURES:
* Multi-layer circuit board
* reliable interface to motherboard
* easy installation using solder template and adaptor board
* compatible with all revisions of ROMs and 520/1040 machines

272. ColorBurst 3000

Newsgroup: comp.sys.atari.st
Date: 1987-11-21 22:57:24 UTC
From: avp@garfield.UUCP
Message-ID: <4244@garfield.UUCP>
Source record: 255872

I have access to this program that supposedly displays something like 3000 colours simultaneously on the ST, unfortunately, I have a mono monitor, so it is of no use to me. Recently, there has been some talk about these greater than 16 colour drawing program stuff, so if there is enough interest, I will post it. This is just a demo for it, I presume. Send requests to me, and If I receive enough, I'll post to the net, Otherwise, I'll send individual copies :-(.

On another note, did Uniterm 2.0 go by? If so, it didn't come to this site, could someone please re-post it, or mail it to me?

Thanks

The Magic Sac emulates the 128K ROMS, needing just the 64K ROMS to get
around the legal end. In other words, Dave can emulate the rest of
the stuff as long as he gets the basics from real Mac ROMS. So the
Magic Sac does run stuff for the 128K ROMS. There's no need for him
to set it up to require the newer ROMS.

>Thanks in advance ... /bill

You'd probably have gotten help faster by sending me your question via
e-mail... You might also have been able to find more immediate help
from your colleagues where you work instead of posting a question to
the entire world.

From what I've seen, ftp always claims zero data bytes were transferred
when retrieving a directory listing. Maybe this is just a vagary of the
Berkeley Unix we run, maybe it's a genuine bug. Rather, it says zero
bytes at the beginning of the transfer, and shows a proper byte count at
the end of the directory listing.

One thing - if you're a genuine ARPAnet site, you may just be timing out.
Since we are on the NSFnet, and since we have something like a 4800 bps
link to the ARPAnet, it's entirely likely that you just got a really bad
connection... (Actually we have a 56kbps satellite link to NCAR, but that
tends to make routing a bit roundabout if you want to use it...) If you're
using 4.3 BSD, your ftp should have a 'reset' command. Issue that a
couple of times, that usually takes care of skewing and timing problems.

Actually, checking our log files, I see that an anonymous person from
ipsa.arpa has successfully logged in via ftp and retrieved a couple files,
so I guess your problem has already been solved. Maybe the networks are
clearing up this weekend...?

Why convert the drawing to troff or pic input? We use devps to convert
troff output to PostScript for printing on either a LaserWriter or Linotronic
and it allows you to include PostScript generated elsewhere into the output.
We teach classes (as well as sell devps :-)) and I use our Atari and
Publishing Partner to create graphics for the class manuals and then include
them in the troff'ed body text. It works just fine.

Date: 1987-11-22 07:36:17 UTC
From: martin@lakesys.UUCP
Message-ID: <296@lakesys.UUCP>
Source record: 255876

I have had NO luck running the latest version of GULAM from an AUTO
folder at boot. I'd like not to go thru a GEM boot just to run another shell!

The previous, alpha, version ran from an AUTO folder without any
problems at all. Am I the only one who has had this trouble? Is there anyone
who has any tips on how to help me get it perform as desired?

To be honest, I am really not the only one who has this same trouble
with GULAM. My cohort has had much computer experience too. Is there something
which escapes us both?

Your sage suggestions are anxiously awaited :-).

I know for a fact that MIDI interfaces do exist for the Amiga, and for around $50 (fifty) dollars. Granted, the cheaper ones don't have a pass-thru, and might even hog your printer port, but you CAN allow an Amiga to drive MIDI stuff without a wallet transplant.

279. VFont to GDOS font conversion utility

Newsgroup: comp.sys.atari.st
Date: 1987-11-22 15:32:32 UTC
From: rwa@auvax.UUCP
Message-ID: <412@auvax.UUCP>
Source record: 255879

Many apologies to Mr Turner, whom I cannot seem to reach via email; here's
the code I kept threatening to post ;-). [I really would prefer to do this
the right way, but its been 6 weeks now...]

The following program attempts to convert Berkeley "Varian Fonts" (vfonts)
to Atari GDOS fonts, with middling success. It is written in MWC (I use
version 2.0, but I know of no reason why it wouldn't go together in version
1.2 just as easily). You Lattice and/or Megamax users are welcome to see
what can be done with this stuff; I can't do it myself. I suspect Alcyon
owners are SOL.

I hereby place this code in the public domain; do whatever you like
with it, attribute it to me or not as you please, et c., et c. I
make no representation of fitness for any purpose, neither will I be
held responsible for any damage direct or indirect, or any claims
arising from the use of this code in any way.

In a word it's a gift and you shouldn't expect too much from it ;-).
Enjoy.

> The Macintosh serial ports are driven by a standard Zilog 8530 SCC on the
> motherboard. [...] Unless of course Atari ALSO uses said chip for
> THEIR serial ports. Anyone know?

Atari uses two different chips for serial i/o. The modem port is driven by a Motorola MC68901 "Multi-Function Peripheral" (MFP) chip, while the midi port gets its bits from a Motorola MC6850 "Asynchronous Communications Interface Adaptor" (ACIA). We can essentailly forget about the midi port in this discussion because 1) it's clocked at a fixed rate and thus we can't tweak the baud to match Appletalk & 2) it's an asynchronous-only part (ACIA, right ;-).

OK, now the MFP is a little more flexible than the ACIA. We can get it to run async up to 62.5 Kbps, and synchronously up to 1Mbps [an aside: my source for _all_ this stuff is the Mostek MK68901 write-up that came with my (otherwise almost *totaly* useless) Developer's Kit. Sure hope it's better than some of the other info; flame, flame!!].

However, there's a rub (and I don't have my Zilog books handy, but I'm pretty sure about this), and that's that the Z8350 is a fairly clever little fellah and knows about things like HDLC bit stuffing and framing, and how to generate/check CRC's on the fly, and station address recognition, and a lot of other stuff which is good to be handled by the serial chip rather than the CPU, especially in a machine as lethargic as a Mac (well, a Mac's lethargic compared to a Sun 3, and that's what I'm used to...) when you're in a network environment and there's a lot of traffic on the backbone which isn't addressed to you in particular, but you have to watch it all anyway because some might be for you eventually. Good grief, what a horrible sentence! But I think that's the case. Whereas the 68901 can sync up to the input datastream and receive/xmit but it has no idea of bit stuffing or CRC's or any of that good stuff. Which means somebody else (and it's not going to be the power supply, foax) is going to have to supply the smarts.

Now assuming Appletalk is built on top of all the nice HDLC stuff that the Z8350 manages so nicely (seems like a safe bet to me; I would have done it that way myself, and Apple never puts hardware in their machines that they don't use to the max), the MFP is at a bit of a disadvantage. The CPU is going to have to do all the clever

stuff; and I would expect the overhead to be pretty painful. Especially all the bit stuffing; lots of shifting and masking and partial-word assembly. CRC's, on the other hand, are easy enough. Still, the overhead gets you down, especially if there are other stations out there on the net - the 68000 is standing there taking interrupts off the 68901, checking the station address, finds the packet's not for him, great - we can throw it away, but in the meantime the user (that's US foax) is standin there waiting for a compile to get done or whatever and its not going along very fast :-(.

Any Appletalk gurus out there? I'm just looking at datasheets and thinking about implementations and bottlenecks. But it's for sure the 68901 is not a very clever synchronous part at all, at all.

281. Cheap monochrome monitors

Newsgroup: comp.sys.atari.st
Date: 1987-11-22 21:26:57 UTC
From: lharris@utgpu.UUCP
Message-ID: <1987Nov22.162657.21962@gpu.utcs.toronto.edu>
Source record: 255881

Has anyone tried to hook up an ibm type monochrome monitor to the ST.
I know the frequencies are different, as is the horizontal sync polarity
but with some minor tweaking it should be possible. The reason for doing
this is ibm monitors around here can be had for about $60-80. The atari
monitor is more than double that.
thanks
/leonard

282. Fcreate() bug and dLibs creat()

Newsgroup: comp.sys.atari.st
Date: 1987-11-22 23:48:46 UTC
From: daemon@stag.UUCP
Message-ID: <262@stag.UUCP>
Source record: 255882

```
>> Occasionally it would create two files
>> with the same name in a single directory.
>
> I found out why: in GEMDOS, Fcreate calls Fdelete, but doesn't check to see
> if the delete actually worked. If the delete fails for some reason, Fcreate
> doesn't notice, and creates another file by the same name.
>
>> I implemented a creat() call in dLibs which always
>> deletes the file before creating it[.]
>
> This won't help, because if Fcreate's call to Fdelete fails, yours will too.
>

This WILL* help, because I check the return value from Fdelete() to be sure
that it succeeds. The code is as follows (from the extended arg proposal):

/*
* Create a new file <filename> with <pmode> permissions
*/
int creat(filename, pmode)
register char *filename;
register int pmode;
{
register int rv;

rv = Fdelete(filename);
if((rv == 0) || (rv == -33)) /* SUCCESS or FILE-NOT-FOUND */
{
if((rv = Fcreate(filename, pmode)) >= 0)
iovector[rv] = 'F';
}
return(rv);
}

> Now here's the tricky part: Fdelete (as called from outside GEMDOS or
> within it, like from Fcreate) checks to see if anybody has the file open.
> If the current process has the file open, Fdelete closes it before deleting
> it. If some OTHER process has the file open, Fdelete returns EACCDN
> ("access denied"). This seems to be what is happening, but I can't
> figure out why, because nobody else has the file open!

Yes. In my implementation of creat(), any error except -33 (EFILNF) will
be returned without calling Fcreate(). Error code -36 (EACCDN) is therefore
returned if the file can't be deleted due to the Fcreate() bug. In emacs,
this causes a file write error and you can then write the file out under a
different name, which is better than silently creating a duplicate.
```

283. Extra functions for XARG implementation

Newsgroup: comp.sys.atari.st
Date: 1987-11-22 23:48:47 UTC
From: daemon@stag.UUCP
Message-ID: <263@stag.UUCP>
Source record: 255883

It seems that in the source code which accompanies the recently posted extended argument passing proposal, I assumed the existence of some functions and a header file which are in dLibs, but are missing from the libraries of some other C compilers. The following code fragments are extracted from dLibs for the benifit of those trying to use the new XARG structure under other compiler/library combinations.

```
----------------------------------CUT--HERE---------------------------------

}
```

----------CUT--HERE----------

You should also check the operation of your strchr() and strrchr() functions. If '\0' is specified as the character to search for, these functions should return a pointer to the '\0' which terminates the string. This is how the Un*x libraries (at least the ones I've used) work, and the XARG code uses strrchr() in this way.

I've included putenv(), but not getenv() since most libraries provide one already. If you need getenv(), send me mail and I'll send you a copy of one that handles MWC-style and TOS-style environment variable, even if they are intermixed (*ack*).

This is a bug and has bitten a colleague of mine also. My apologies.
It has been fixed. Those needing the corrected version, send me a
diskette and SASE. I should be releasing the next version in Jan 88.

285. blkcpy() correction

Newsgroup: comp.sys.atari.st
Date: 1987-11-23 07:06:35 UTC
From: daemon@stag.UUCP
Message-ID: <264@stag.UUCP>
Source record: 255885

ARGH!! Sure enough, the best way to find bugs in a piece of code is to release it to the public. There is a minor bug in the blkcpy() function that I just posted, so here is the corrected version... sorry...

```
[BLKCPY.S]
* char *blkcpy(dest, source, len)
* register char *dest;
* register char *source;
* register int len;
* /*
* * Copies the <source> block to the <dest>. <len> bytes are
* * always copied. No terminator is added to <dest>. A pointer
* * to <dest> is returned.
* */
* {
* register char *p = dest;
*
* if(source < dest)
* {
* dest += len;
* source += len;
* while(len--)
* *--dest = *--source;
* }
* else
* {
* while(len--)
* *dest++ = *source++;
* }
* return(p);
* }

.text
.globl _blkcpy
_blkcpy:
clr.l d0
move.w 12(a7),d0 ; number of bytes
blkcpy0:
move.l 4(a7),a1 ; destination
move.l 8(a7),a0 ; source
cmp.l a0,a1 ; check copy direction
bls blkcpy4
add.l d0,a0 ; move pointers to end
add.l d0,a1
bra blkcpy2
```

```
blkcpy1:
move.b -(a0),-(a1) ; (s < d) copy loop
blkcpy2:
dbra d0,blkcpy1
bra blkcpy5
blkcpy3:
move.b (a0)+,(a1)+ ; (s >= d) copy loop
blkcpy4:
dbra d0,blkcpy3
blkcpy5:
move.l 4(a7),d0 ; return destination pointer
rts
```

This thing might seem funny or strange or whatever *(#&~%&*#|~%(|&%~ to
ASCII-ppl: Our network account mode is determined 99.9% by some computers
painted blue on the outside.
As a *periphery* we have only ASCII machines, running UNIX, TOS and MS-DOS.
Two problems arise out of this:
First we cannot (or do not know how to) reach net.sources or the like.
Second, there is a strange interchange of characters when we download UU files.
++++++++++++ QUESTION:
Are there any ppl on this list which can help me out of that? I surely would
appreciate some hint from s.o. who's net account is also managed via a
non-ASCII coded machine !!!

287. Gulam and TeXinfo

Newsgroup: comp.sys.atari.st
Date: 1987-11-23 14:38:32 UTC
From: csrobe@ICASE.ARPA.UUCP
Message-ID: <8711231438.AA03524@work15.icase>
Source record: 255887

I have been using Gulam (beta version) for about a week now (thanks lee dickey :-) and i haven't had a problem yet ('cept one, which you will see in a minute). For those of you who remember my problem with OSS PP and Flash steping on each other in Gulam, that problem was fixed in this release.

One really great improvement, is that the documentation comes a "TeX-able" user's manual. TeXable iff you 1) have GNU emacs and TeXinfo.tex, or 2) TeXinfo.tex and a williness to do a few minor changes, or 3) just TeX, and editor, and some patience. [Luckily, the authors also included a straight ascii version of the manual for the less fortunate.]

Anyway, I fall into the second group, which isn't so bad -- only two TeXinfo commands aren't recognized: '@emph{}' and '@unnumberedsubsec'. @unnumberedsubsec is listed in the TeXinfo documentation, but doesn't seem to be implemented. @emph is just not there, anywhere, but i was able to change it to @i{} ('i' for italics instead of 'emph'asis) and it worked.

The documentation also comes with some (customized) .el files to do some conversions. Perhaps this takes care of the @emph and @unnumberedsubsec problems but it's hard for me to tell since it is designed for GNU emacs (lisp-like) extension language.

I was really surprised that, given the effort that went into producing such a quality shell, that the TeX documentation would be distributed without the TeXinfo input file. I am hoping that mine is out of date, and that I can find a more complete version. I have written to the authors but they have yet to reply (and if the future resembles the past, they won't).

So, can anybody out there help me? Since our system administrator refuses to put GNU emacs on our system, that option is right out. Does anybody have a more complete version of TeXinfo (mine is dated 1985)?

Thanks,
-chip

From: tim@brspyr1.BRS.Com
Message-ID: <2212@brspyr1.BRS.Com>
Source record: 255890

Sorry, guess I wasn't very clear the first time around. Here is a
clarification.

in article <2205@brspyr1.BRS.Com>, tim@brspyr1.BRS.Com (Tim Northrup) says:
>
> Does anyone out there know if there is an ST program comparable to
> MacDraw or preferably SuperPaint? Degas is okay, but seems to be
> limited to output for a screen, and not the printed page.

Yes, Degas will print okay. What I meant was that the SIZE of the drawing
seems to be limited to the screen SIZE. I want something that will allow
me to layout a printed PAGE, not half a page at a time. Also something more
object oriented is desired.

Any help would be appreciated.

292. Beckmeyer C-shell bug (was: Source for a system() routine needed)

Newsgroup: comp.sys.atari.st
Date: 1987-11-23 16:54:26 UTC
From: preston@felix.UUCP
Message-ID: <13782@felix.UUCP>
Source record: 255892

In article <1845@chinet.UUCP> dag@chinet.UUCP (Daniel A. Glasser) writes:
>In article <13021@felix.UUCP> preston@felix.UUCP (Preston Bannister) writes:

>>Has anyone out there implemented a version of the system() library
>>routine that uses the Mark Williams/Beckmeyer scheme for passing long
>>argument lists?

>>Unfortunately, the system() routine in the Mark Williams library does
>>not. The argument list gets truncated after 127 characters.

>Not true! The Mark Williams library DOES use the environment scheme
>for system()... It calls up the shell, msh.prg, and msh calls up the
>command. If you are getting truncated command lines, something is
>screwing around with the "ARGV" or "IOVECT" environment string and
>the runtime startup is not finding the parameters in the environment.

On further investigation, you're right...sort of. The problem, as it
turns out, is that the Beckmeyer C-shell does not handle very long
single arguments.

The MWC system() passes through the string given to it as a single
argument. I.e. the call:

```
system("foo bar baz");
```

Becomes a call to the default shell with the following MWC extended
argument list appended to the environment (assume the SHELL environment
variable is set to 'shell.prg', the iovector is approximate):

```
ARGV=CCCA????????????????
shell.prg
-c
foo bar baz
```

Note that the string passed to the system() call is passed through as
a single argument.

I had the SHELL environment variable set to 'csh.prg', the Beckmeyer
C-shell. When csh was given a single argument longer than 127
characters, it truncates the argument.

The shell supplied with MWC (msh) can handle single arguments that are
longer than 127 characters.

So where does this leave us?

1. Use 'msh' for the default shell in makefiles where the argument
list may be longer than 127 characters. (I set the environment

variable SHELL to 'msh.prg' at boot time with GEMBOOT).

2. The system() function should be fixed to spilt up the command
string passed to it into an argument list. (My opinion).

3. The Beckmeyer C-shell (and other shells :-) should be prepared to
handle single arguments longer than 127 characters. (My opinion).

Date: 1987-11-23 17:21:09 UTC
From: mikeb@hpqtdla.HP.COM
Message-ID: <2210003@hpqtdla.HP.COM>
Source record: 255893

>I guess my point is, Will Atari come out with their transputer BEFORE
>Apple, Commodore, IBM, etc. make their own and STEAL the market from Atari?

Does it matter. Since transputers have to use the 10M Inmos links
they are an ideal for linking up machines from different manufacturers.

Then when your Atari need some extra horsepower it farms it out to a
PC with a tranputer doing nothing, and vice versa of course.
Hey presto everybody uses their favourite machine but with real speed!

Of course this all sounds wonderful. Unfortunately the catch comes
(as usual) with the software and the interconnections. Can we conect
up 100s of PCs via transputer links in such a way that the operating
systems can find idle nodes, and then is the software structured so
that it can actually work.

SF fans may recall that ORAC in Blake's 7 had this capability. Will
we have to wait several centuries?

294. Prolog for the ST

Newsgroup: comp.sys.atari.st

I'm currently starting to work on my thesis and I need to use the language Prolog. Does anyone have any experience working with any of the Prologs for the ST? I heard there was a public domain version, but I haven't got a chance to try that out yet. Are there anyother versions available?

Thanks in Advance,

Dan

295. Re: Atari ST, Mac emulator and TOPS network

Newsgroup: comp.sys.atari.st
Date: 1987-11-23 19:10:07 UTC
From: egisin@orchid.waterloo.edu
Message-ID: <11801@orchid.waterloo.edu>
Source record: 255895

In the reference article, Ross Alexander writes about appletalk and the ST's 68901.

I don't think it would be feasible. Appletalk has a bit rate of 230K,
or about 80K characters per second.
The Mac's serial controller is interrupt driven, but has a 3 byte silo.

The 68901 has a single byte buffer, and would have process interrupts in 12 useconds,
or do polled IO. It would also have to do bit stuffing on the fly to find flag
sequences. The 68000 is not quite fast enough for all that.

296. Re: GULAM beta (bug???)

> I have had NO luck running the latest version of GULAM from an AUTO
> folder at boot. I'd like not to go thru a GEM boot just to run another shell!

The new version assumes the A-line structure has been initialized,
which is not the case when AUTO programs are run.

I wrote a short program to initialize it (by using v_openwk),
then Pexec \bin\gulam.prg. I'll send you a copy, or post it if there is demand.

297. Magic Sac information

Newsgroup: comp.sys.atari.st
Date: 1987-11-23 20:27:28 UTC
From: rowley@ORVILLE.NAS.NASA.GOV
Message-ID: <8711232027.AA14374@orville.nas.nasa.gov>
Source record: 255897

I got version 4.5 of the Magic Sac software recently. The Sac works well with a partition on my SH-204 hard disk.

Here is a list of software that seems to work well with the Sac:
Finder 6.0
System 4.2
MacWrite 4.6
MacDraft 1.2a
MacDraw 1.9.5
Microsoft Excel 1.03
Microsoft Word 3.01
Versaterm 2.3
Binhex 5.0

I found some software that trashes out the Sac:
Red Ryder 9.2
New Scrapbook DA
Meminfo DA (made useless by the new finder anyway)

On Genie, Dave Small writes that he has tried "Hype-card" (sic), and it doesn't work with the Sac. Also, he says that an upgrade to the 128K ROM's is not something he is likely to take on in the near future.

Would anyone else care to add to the works/doesn't work list?

>the modulators a dealer installed option?
>

In a related note, even if it's not "Atari policy" to make the kind
of changes to a 1040 we're discussing here, -will-it-work-? Atari HQ
has this unfortunate attitude problem... The seem to think that if
they haven't thought up some hardware feature, then they won't do
anything to help users obtain that capability. This is one case where
Atari is the only source of information on this subject. If users see
that Atari is willing to help users obtain new horizons with their
machines, then people are more likely to recommend Atari when friends
ask about getting a new machine. On the other hand, offen I find it
difficult to recommend getting an ST when Atari spends so much effort
blocking, and so little effort to help, the average user who just wants
to do "a little bit more" with their machines.

I heartily agree. Recently I had some problems with extended formats and interchange of disks with friends, so I decided to look at this in detail.

Ever check your drive speed using the only (to my knowledge) public domain speed checker? It's called DSPEED.TOS and was written by Mike Curry a long time ago. It seemed strange that most (hmmm, come to think of it - ALL) of the disk drives I tried it on ran a little fast - from 302-304 rpm.

Well recently a friend, who has been using IBM-vintage 3.5" drives on his ST, told me an interesting story. He said that he tweaked his drive speed to 300.030 using DSPEED.TOS, and then connected the drive mechanism to his IBM. Using an MS-DOS disk speed program he got 297 rpm!!!!

The solution, as suggested, is to use a strobe disk. Trouble is, not many ST drives have one. I stole one off an old dead Tandon mechanism and put it on my SF314's flywheel. Lo and behold, DSPEED.TOS reads 303.54 when the strobe is exactly stationary.

Conclusions:
1. If you can get one, adjust your disk drives with a strobe disk.
2. Beware of DSPEED.TOS; 303-304 rpm by it's reckoning may very well be right on the mark!

301. 1040ST lack of dealers

Newsgroup: comp.sys.atari.st
Date: 1987-11-23 23:04:28 UTC
From: john@cooper.cooper.EDU
Message-ID: <1129@cooper.cooper.EDU>
Source record: 255951

Hi,
I just attended the Consumer Electronics Show in Nassau Coliseum,NY.
There was not one vender that had Atari 1040/520 hardware or software.
At least last year there were 2 or 3 venders that sold Atari. The
situation is not much better when trying to find places that sell Atari
in Nassau County. There are only about 5 and they have small selections
of software, most of which are games. Finding hardware is even more difficult.
I would like someone from Atari to comment on this.

Source record: 255952

Someone asked about d/a converters for the atari. I have a hippo-sound,
which is now manufactured by someone else. I was able to use it for some
signal processing experiments (although I uplead the sound files to a VAX)
I do not recommend it for any serious music applications, it is very noisy.
In fact, it always has a DC hum recorded, you can filter it by adding 17
to each sample. The software is not bad, but could you some more features.
I don't really recommend it, but it might serve your purposes if they
are not so demanding.
JEFF BEER UUCJEFF@ECNCDC

Actually, I tracked down this rumour to an article written in Keyboard
magazine last year by the president of Digidesign. (I once posted the
issue and page number, but it didn't seem to make it out to netland)
In the article, he said that the Amiga had serious problems with time
stamping that preventing it from becoming a professional MIDI machine.
The same sentiment was repeated in another Keyboard column
months after that, and then spread throughout the country by word
of mouth. I don't know if it is true or not, but that is who started
it all.

Summary:Is it like this everwhere?
Keywords:Dealers

I have been seeing alot of messages in the last while about there being
a shortage of dealers. Well I must say that we have very good up here in
Nova Scotia Canada, our local dealer has roughly 300-400 titles in stock at
all times for the 8-bit and ST computers. The selection in nothing short
great. We seem to get all the titles before alot of other dealers for some
reason???? And to boot we are a full repair dealer. There is always hardware
in stock(only one blittered Mega yet so far, Are you listining Atari?).
Well I do feel sorry for anyone that does not have the support that they
should have, a machine like the ST should have the best support in the
industry.
Later
Barry

Source record: 255955

Please correct me if I am wrong, but isn't the drive speed on the ST
drives controlled by the strobe only, I had a look at one at the shop
and it looked as if there were no adjustments???

> able to correct the problem.

More precisely, you will need to rotate the yoke. The yoke is the large,
round electromagnet around the neck of the CRT proper. You will have
to loosen a small clamp which is located just forward of the CRT socket.
Rotate the yoke until the picture is no longer tilted. Be careful not to
touch any terminals on the yoke while doing this.

There are adjustments on the chassis which will allow you to enlarge the
size of the picture somewhat. For the horizontal dimension, there will be
a trim-pot with the marking "width" near it. There are usually two
adjustments for the vertical. One is usually marked "vert. size", and the
other "vert. linearity". The "size" adjustment will make the picture
larger in the vertical dimension, and the other (simply put) will make sure
that identical characters at the top of the screen are the same height as
those at the bottom.

You will need a very small, flat blade screwdriver to turn these adjustments.
If you have insulated or better yet plastic tools, I'd reccomend using those.
It's kinda easy to have an ordinary screwdriver slip on you while you're
watching the screen and making adjustments.

From: ftw@datacube.UUCP
Message-ID: <105100033@datacube>
Source record: 255957

Don't ground DTACK. If your ST works at all after doing that, it will in all likelyhood crash and burn VERY quickly.

DTACK is a signal to the 68K that tells it that data is ready to be read or has finished writing. DTACK is an acronym for Data Transfer ACKnowledge. Grounding it would have the effect of asserting DTACK continuously, faking the 68K into always beleiving that it can read its data lines, or that a write has finished (and the data lines can now change state safely).

Don't do it.

>around the legal end. In other words, Dave can emulate the rest of
>the stuff as long as he gets the basics from real Mac ROMS. So the
>Magic Sac does run stuff for the 128K ROMS. There's no need for him
>to set it up to require the newer ROMS.
I was mis-remembering the following:
This is what I got from Data Pacific this month:
| 128K and 256K ROMS
| Many users ask when we will support the newer 128K and 256K ROMs
|from Apple. We do not plan to support these ROMs with the MAGIC SAC,
|primarily because the code which is contained inside of these ROMs
|will be provided by our software. Thus, _there is no advantage in the
|use of these ROMs over the 64K ROMs_ with the Magic Sac.
| Software Compatibility
| . . . general rule of thumb is: If the software is Macintosh II
|comptaible, was written to conform to the Apple Macintosh programming
|guidelines, and does not access hardware directly, then it is usually
|compatible with the MAGIC SAC.

So anyway, they're saying in this release that the 128K and 256K ROMs
will be covered in software. I would guess that like all future plans
that could change. |-)

Although I never encounter this problem myself, I have seen it on some
disk before with the two files having the same name(which cause problem
when trying to delete one of them). From the description of the problem
it sounds like Emacs or anything other program might have two or more
files open and you are trying to save a file that is not the LAST file
opened by the program. Of course I could by wrong on this but this is
my opinion and nobody else.

Muke Schuster and others have written about setting drive speeds, et c., and the fact that strobe wheels are a a good deal more accurate than DSPEED.TOS or whatever. Fine. But there has been an unspoken assumption all along, and that is: You want your drive to be going _exactly_ 300 RPM. I question this. Yes, that's the specification alright, but there is a good reason to run your drives a little bit SLOWER (say, 297 RPM or so).

The reason is thusly: if you are using one of those clever formatters, such as DCFORMAT or any of its ilk, that can put 10 sectors on a track, the last gap (Gap #4, made out of 0x4e's) gets a little bit shorter than normal, which is 1401 bytes; it gets trimmed down to 780-odd bytes. It's not a bad idea, however, to run slightly larger than normal Gap 3's (normally 40 bytes, I like to double this), and then Gap 4 really gets crowded. But if you run the drive a little slow, the effect is that to the 1770, all the tracks look a little longer than normal, and you get your Gap 4 size back to something reasonable. You can check this by looking at the data coming off the read line with an oscilliscope (take the scope sync input from the index pulse line) and noting how close the end of the last sector comes to the end of the track.

I have done this routinely for years and find it doesn't generate any trouble if you are only 1 or 2% slow; the PLL in the data separator can handle this kind of an error with it's eyes closed, and the added security of the longer gaps helps to overcome all kinds of write-skew and drive wow-and-flutter problems.

In answer to some of Charles' questions about the Magic Sac:

in article <4340@mnetor.UUCP>, charles@mnetor.UUCP (Charles Benaiah) says:
|>The Magic Sac works with the 64K ROMs, and even Apple has announced that they
|>will no longer support the 64K ROMs anymore - most new commercial applications
|>that I have seen require the 128K ROMs.
|
| Does this mean that the machine has to be opened, and the new ROMs inserted,
| or are they plugged into some external box?

The Sac is a plug-in expansion module which pops into the cartridge port on
the side of the ST. The box contains slots for the 2 Apple ROMs and a few
other components (like a battery powered CLOCK which keeps the correct time
even when the system is powered off; very nice).

> Will this system (transaltor 1) also work for internal drives, or does this
> box connect to the MIDI, and to some external drive?

The Translator 1 is said to work with internal as well as external drives.
I don't think it connects to the MIDI port however, I think it just goes
between the floppy connector on the ST and the floppy drive: the description
says something to the effect that internal drive accesses will make some
access to the external port FIRST, allowing the Translator 1 do "something".

Hope this helps.

Date: 24 November 1987, 16:32:16 SET
From: Roland Waldi phone (6221) 564334 WALDI at DHDIHEP1
Inst. fuer Hochenergiephysik
Schroederstr. 90
D-6900 Heidelberg
To: INFO-ATA at SCORE.ST

The latest version of KBEXT is now available from UH-INFO at UHUPVM1
in BITNET. It is two versions of PD program + assembler source + doc.
To remind you what it does: KBEXT allows installation of 5 keyboard
tables instead of the usual 3. The 2 additional ones are used with
ALT and SHIFT ALT. Thus you can use all 256 Atari characters from the
keyboard in most programs (editors, graphic programs, dialogs etc.).
If you need ALT-xxx as a control key, try ALT-CTRL-xxx. This ignores
the tables, and works with most programs using ALT + some key for
control purposes. The version on LISTSERV at CANADA01 is now obsolete.

Enjoy,
Roland Waldi

P.S. Those who cannot access UHUPVM1: if you want the program, tell
me a distribution place in your net where to post it. I don't know
how to reach COMP.ATARI.xxx.ST or whatever newsgroups are called in other
nets. To post it, I need a USER, NODE and NET, not a complicated
path, which I don't know how to apply.

> as the ad claims, then is it also as slow, or slower?

I wasn't the person who commented, but I just got Spectrum 512 and love it. All those colours! Some operations are slower than the other programs, but they are justified. For example, copying a block from the buffer to the screen is slower, but they have a lot of work to do to merge the pallettes of the two pictures. The manual says that about 80% of the cpu time is taken by the pallette switches. During some intensive operations, such as anti-aliasing, the program gives up the pallette switching to provide faster computation. During this time, the screen looks like garbage. Actual drawing speed is good. Rubber-band lines keep up with the mouse, no problem. I have no complaints.

Well, since he chose to make it public this way, I am compelled to confirm: Landon Dyer left Atari Corp. recently in favor of Apple Computer. It is not for me to say here what his reasons were: ask him.

I am now The Keeper Of GEMDOS, The BIOS, and Things Like That. My subtitle is Loremaster, since so much of the OS is folklore. Landon has an agreement with Atari to maintain Mad Mac, but that is the extent of his connection with us.

I wasn't keeping this secret; I just didn't tell anybody. (You all certainly did notice that he wasn't on the net any more...)

Anyway, keep those cards and letters coming!

There is an adapter available that converts the RGB into composite video.
Actually there are 2 -- one from JNL Technologies on Long Island, and the
other from Practical Solutions of Tucson. I am not sure if either is
actually on sale yet, but I've seen both at various shows and they do a good
job.

It's just as hard to put composite video out as it is to do Rf. Once you
have one, it's a short step to the other. That's why they're both missing.

Yes and no. One thing that can be done is to use two pictures and page flip between them. Two different color will merge to a new color. One has to be careful though to keep the intensity of the two different colors close together or else it flickers.

I second the motion. :-)

I can understand Atari leaving the RF modulator off the 1040ST
(although I think the reasoning as a bit cockeyed). But, I _would_
like to have one on my machine.

Now, I imagine that coming up with an upgrade probably wouldn't be
profitable for Atari. Let me suggest an alternative.

Neil, why don't you see if Atari could least sell us the parts we need
to put in an RF modulator? I'm sure that some enterprising people
will come forward and offer to do the upgrades. It would cost Atari
nothing, build some goodwill and possibly even give Atari's dealers a
little more business.

Sorry, the scan rates are too different. The Atari monochrome monitor uses a > 30 KHz scan rate vs. the 18 KHz scan on the IBM monochrome monitor. This is beyond the range of any adjustments or simple fixes.

From: landon@apple.UUCP
Message-ID: <6826@apple.UUCP>
Source record: 255973

0. I took Spectrum apart with a logic analyzer one day. This is not for the faint of heart:

1. Spectrum 512 is a kernel (any 2600 programmers out there?).

2. There is a clever synchronization technique. Basically they use the video scan register (the low byte of it) to determine how far the processor is into the line, using it as a jump-index into a table of NOPs when it changes. The number of NOPs is (are?) tuned so the 68000 starts off "on the right foot" of the kernel.

3. All interrupts are off (IPL-7) during the kernel, naturally.

4. Each line of the kernel itself looks something like:

```
MOVEM.L <location>,<register-mask> ; suck-in pallette assignments
MOVEM.L <register-mask>,COLOR0 ; set pallette registers
MOVEM.L <location>,<register-mask> ; suck-in pallette assignments
MOVEM.L <register-mask>,COLOR0 ; set pallette registers
MOVEM.L <location>,<register-mask> ; suck-in pallette assignments
MOVEM.L <register-mask>,COLOR0 ; set pallette registers
(NOPs for alignment) ; sync with next scanline
```

Quiz: how many registers do you need? How many cycles does this take? [Hint: you can get about 3.5 complete pallette changes on a scanline].

5. This gets you 48+ colors on a LINE. I don't know how to get 48 CONSECUTIVE colors -- I suspect it is impossible without playing tricks with alternating video frames. There may be other even more hair-raising things you can do with MOVEM, however.

Internal as well as external. Many copy protected programs will now
work just fine on the Magic Sac when run on an ST with the
Translator-One attatched. (Before anyone asks, yes, you can format a
disk on the ST using Translator-One, put some files one it, take it to
a Mac, and then read/use the files on the Mac...)

326. UUCP: Tips for those uucp'ing UUPC from van-bc

Newsgroup: comp.sys.atari.st
Date: 1987-11-25 11:06:12 UTC
From: skl@van-bc.UUCP
Message-ID: <1563@van-bc.UUCP>
Source record: 255976
Cross-posted to: comp.mail.uucp,comp.sys.ibm.pc,comp.sys.mac,comp.sys.amiga,comp.sys.atari.st,comp.sources.d

For those who plan to directly uucp the UUPC distribution from van-bc,
please note that (for technical reason) you cannot use wildcard in the
uucp command when uucp'ing from van-bc, the name of the files to be
copied must be specified explicitly in separate uucp commands.

A list of the files available for uucp is in the file van-bc!~/uupc/INDEX .

Sorry for any inconvenience.

Does anyone have, or know where I can get, info on SCSI?
(including what it stands for :-)
I need both hardware and software data.
I will be getting some sort of scsi adapter (info and recomendations
on those would be nice, too) for my Atari 1040ST,
and a hard disk, and also will be making another device which
I want to connect to the ST via scsi.

PS Is one hard disk controller needed for each drive, or just one overall?

Re: Filetransfer between AT-Clone and Atari St

I have an Atari 520 ST+ and an AT-Clone. Now I want to download some Files
from the AT to the Atari. I tried it and Terminal mode works well, but
Filetransfer with Kermit does not!! I put the AT in Server mode and started
a GET (from Server) Command on the Atari. The AT went into Send File mode but
got no acknoledge from the Atari.
What pins must I connect between the computers, what communication parameters
must I choose?
I used UNITERM 1.7a and MS-Kermit 2.29c. Following Pins were connected:
AT ATARI
1 --------------- 1 THE PIN FUNCTION IS THE SAME ON ATARI AND AT!
2 --------------- 3 2 = TX
3 --------------- 2 3 = RX
4 --------------- 5 4 = CTS
5 --------------- 4 5 = RTS
6 --------------- 20 6 = DTR ?
7 --------------- 7 7 = GND
8 --------------- 20 8 = DSR ?
20 --------------- 6 20 = DCD ?
20 --------------- 8

Please, can someone out in the net give me some help?!
E-Mail direct to UNM407 at DBNRHRZ1.BITNET or to the digest.
Thanks in advance

From: csrobe@ICASE.ARPA.UUCP
Message-ID: <8711251319.AA06042@work15.icase>
Source record: 255979

For those interested, i found a complete copy of the TeXinfo macros for
TeX plus a reference manual for the TeXinfo. Once I got this and ran
the Gulam manual through TeX, I got one beautiful manual.

If anyone needs the TeXinfo stuff (texinfo.tex and texinfo.texinfo)
I will gladly send them along -- each is about 50k.

TeXinfo is the 'official' document format for the GNU project and is
designed for producing hardcopy manuals and on-line documentation
(in a hypertext-like form) from the same source document.

330. strange bug?

Newsgroup: comp.sys.atari.st
Date: 1987-11-25 13:24:10 UTC
From: brianp@ernie.Berkeley.EDU
Message-ID: <21951@ucbvax.BERKELEY.EDU>
Source record: 255980

I wrote a little routine which just jumped to an exception handling routine,
and put the address of my routine in the exception vector in place of the
original. If the exception was the divide by zero, it worked as expected.
When it was the midi/kboard exception, the results were strange.
My routine was like this:
move.l #fc281c a0
jmp (a0)

with the routine's address in $118. (actually, I wrote it in Forth,
so it was all backwards.) The result varied depending on whether
I used a0, a1, or a2.

a0 caused the computer to just die,
a1 caused one of [illegal instruction, address error, bus error]
at random to happen,
a2 caused beeps.

The a1 and a2 ones did their thing some but not all times I hit a
computer key, and also did their things sometimes when a midi byte
went in. The a2 one also made blocks of randomly colored pixels
occaisionally, which were the width of the screen, and went from some point
on the screen down to just above the next prompt-n-cursor on the screen.
I could fix the a2 version by replacing fc281c in 118. The a1
one wouldn't let me type that many consecutive characters per prompt.

Does anyone know what would cause that behaviour? Might it be
fried hardware, buggy roms, bugs in my software (Forthmacs by Mitch Bradley -
quite a useful package), or something I don't know about how exceptions
happen and interact and whatever ????? Thanx for any info!

Brian Peterson, ...!ucbvax!ucbernie!brianp (brianp@ernie.berkeley.edu)

331. Information about the linea routines.

Newsgroup: comp.sys.atari.st
Date: 1987-11-25 16:26:26 UTC
From: keb@picuxa.UUCP
Message-ID: <392@picuxa.UUCP>
Source record: 255981

I have a Megamax C compiler Version 1.1 and would like to utilize the linea routines from the in-line assembler. Specifically, I only need to write a pixel to the screen ($a001 - linea opcode). The information that I am currently using, the ABACUS ST Internals book, is not very clear about what variables must be declared and initalized for the routines to function. Megamax on the other hand is not very clear with their explanation of variable passing to and from the assembly routines. Would someone please be willing to recommend a good reference guide for the linea routines or better yet provide a simple example of the code for the Megamax C compiler.

Thanks in advance.

> /* returns EACCDN: Proc1 has file open */
>
> Fcreate("file2",0);
> /* works, even though it should fail */
>
> Pterm0();
> Pterm0();
```

What you are forgetting is that the first Fcreate not only creates the file, it also opens it and returns a file handle (long) which can be used in any I/O later on. It is for this reason that the Fdelete in Proc2 fails.

Actually, Fcreate is often preferable over Fopen because what it seems to do is it checks to see if the file exists and, if it does, it tries to open the file. Otherwise it creates a new file with that name and opens it. I do agree that it *does* (this is the bug) create a new file if the file is already opened. (Maybe the type of access matters? Would an Fopen(file, READ_ONLY) also mess things up? I may try that and see...)

On the subject of my earlier letter regarding what I thought were several bugs in MWC...

The first complaint was universally agreed upon to be the fault of the compiler. Both:

```
int i = -32768;
```

and

```
unsigned int i = 60000;
```

should be valid but the compiler always produces the message 'integer "i" promoted to long'.

In my second example, however, the bug was my own. I made the mistake of not testing this thoroughly enough. The situation in which I was getting what I thought was an incorrect result was not as I stated in my example. The example does work correctly, my apologies; my problem arose when the operand being added to was a character pointer. Normally, if you try something like:

```
char *c;
c = <any long number that is the result of calculations>
```

the compiler comes back with an "integer pointer pun" warning, however this is not the case when the "=" is instead a "+=". Certainly, if the compiler truly perceives a character pointer as being only 16 bits long (as the warning message and the fact that the only way to avoid it is to change the line to "(long) c = ..." would have me believe) then adding a long to it without any type conversion would lead to strange results. Maybe somebody could enlighten me a bit though: Why should the type cast be necessary? Since a pointer is an address in memory, shouldn't it always be 32 bits long? If not, should the compiler also warn me when I am trying to += what it sees as being a 16 bit address with a long number?

I just ran the following program with the results that follow:

```
main(){
char *c;
long i;

i = 99999L;
c = 0L;
printf( "c: %D n", c );
c += i;
printf( "c += i: %D n", c );
c = i; /*gives "integer pointer pun" warning*/
printf( "c = i: %D n", c );
}
c: 0
c += i: 1
c = i: 99999
```

So it would appear that even though it calls the last one a pun (why not the first one too?) it does assign the value correctly. For whatever reason the second one seems to be incorrect though. Any ideas?

I apologize fort he incorrect example in my first letter (and also for using the phrase "ones compliment". Can you say, "stop writing letters at 3 am?" I knew that you could...)

>|primarily because the code which is contained inside of these ROMs
>|will be provided by our software. Thus, _there is no advantage in the
>|use of these ROMs over the 64K ROMs_ with the Magic Sac.

It will be interesting to see if they can pull this off (legally).

Some of the new routines in the 128K ROMs are extensions of those in the 64K ROMs (eg, the new Resource Manager calls). But others are not extensions (eg, the new Quickdraw calls). It will be difficult to implement all these calls without copying the actual ROMs. The problem is even worse for 256K ROMs, expecially with Color Quickdraw. (I don't see any way they can duplicate all of Color Quickdraw.)

Also, some of the changes were performance improvements, especially in the Resource Manager and Quickdraw. Unless they reimplement these routines as well, it is not true that "there is no advantage" in the use of the 128K & 256K ROMs; the actual ROMs will have better performance.

Message-ID: <871125203243.075429@HIS-PHOENIX-MULTICS.ARPA>
Source record: 255986

I am very depressed, I just saw a pretty good commercial on tv for the Amiga. When will Atari learn? All of the television commercials I see for Atari are for their game systems, but if they want to change their image, shouldn't they advertise their computers? The Amiga commercial said that they even have a 1-800 number to get information and a home demonstration. I have a feeling that the Amiga ads are going to start popping up during sprots. This is what Apple and IBM do, why dosn't Atari? Is it asking too much for Atari too have good marketing? I think some advertising will bring them more business than buying out the Federated chain. I keep hoping for a miracle. Will Atari ever realize that the only way to lose its game image is through marketing? That is how IBM did it. They never were that great a computer. But their marketing made people think they were. The ST is a great computer, but will Atari ever convince any one that it is?

I didn't mean to flame anyone, I guess I'm just hoping that my two cents worth may make a difference. I just had to try.

337. Datafree's Memory upgrade for Atari 520ST/STfm and 1040ST

Newsgroup: comp.sys.atari.st
Date: 1987-11-25 21:48:23 UTC
From: usenet@mcdchg.UUCP
Message-ID: <2615@mcdchg.UUCP>
Source record: 255987
Cross-posted to: comp.newprod,comp.sys.atari.st

Datafree announces their 2.5/4 megabyte memory expansion board for the
Atari 520ST, 520STfm and 1040ST computers.

Datafree's memory upgrade board for the Atari ST computer expands
memory space to either 2.5 or 4 megabytes. It consists of a memory
plane that interfaces via a plug-in adaptor board and a template that
requires only 18 solder connections to the MMU.

Quality multi-layer circuit board construction ensures noise free
operation with 120ns 1 megabit dynamic ram from any manufacturer.

It has been tested in all revisions of 520ST, 520STfm and 1040ST
and is compatible with both TOS for the 520/1040 series and the
new blitter compatible Mega ST TOS roms.

FEATURES:
* Multi-layer circuit board
* reliable interface to motherboard
* easy installation using solder template and adaptor board
* compatible with all revisions of ROMs and 520/1040 machines

For more information contact:
Datafree Industries
391 Ormont Drive

Hi,

The September 1987 issue of ST Applications mentions an interesting
program. It is described as a 'full-blown 11/780 Vax-Unix-like system'
running on a 520 ST. This product is made by A.N.D. Corporation of New Orleans.It is
supposed to be a real time Unix system that is multi-user
(up to 8 terminals) and multi-tasking. Does anyone know anything else about
it? I think it would be great to have full Unix on the ST. Please respond
directly to me, or if you think it is worthwhile- post responses(comments, etc.)to the net.

341. AES in interrupts (was RE: ?strange bug) help wanted

Newsgroup: comp.sys.atari.st
Date: 1987-11-26 02:46:16 UTC
From: wallman@yale.UUCP
Message-ID: <19536@yale-celray.yale.UUCP>
Source record: 255991

Moshe Braner's answer about interrupt redirection has reminded me of one of my big unsolved problems.
The task was to create a little resident gadget that fooled well-behaved programs into thinking they were running in Hi-Res.

I tried to patch into the XBIOS trap (successfully) intercept only Getrez() calls, passing by the rest to the OS (successfully) and returning a value to the calling procedure (successfully). Then I tried calling a form_alert() from within the TRAP (unsuccessfully).

The problem here was that AES needs to be called from usermode (*).
I set up a rather elaborate scheme that involved using a free TRAP and a handsomely sized user-stack. Finally I got it to work ONCE.
The alert popped up, I could choose a resolution and the appropriate value was returned. But only ONCE, the next time it crashed. I don't know why...
It sounds like a stack overflow but I allocated 4K and that sounds like plenty, especially for a small form_alert.

Has anyone done something similiar ? Or can someone give a possible explanations why it doesn't/ can't /never will work ?

Thanks very much in advance...

Footnote :
(*) Strangely enough all the stuff written in assembler such as XBIOS & BIOS are usually uncomplicated and relatively bug free, whereas the stuff written in C like AES and VDI (I don't know about GEMDOS but I fear the worST) is either buggy or sloppily written and even worse incomplete. :-|

Flame ON
Oh the wonder of a well thought out system!
'Why should any one need more that 127 characters in an
argument string? Hard code it in boys.'

DRI SOftware person.

'Why should we get a good operating system when we can
buy this one from DRI. And look we can only pass 127
characters as arguments. Oh well Document it so that
it becomes a feature and not a bug'

Overheard in a Ferrari dealership
Flame off

A proposal for extended argument passing is floatting around
Instead of forgetting about it lets adopt it.
You ask how? This is how.
First Atari will endorse it and fix their compilers so that they support
it, then They will release free roms that fix this and other bugs, then
all the software houses will adopt it.

Date: 1987-11-26 07:36:05 UTC
From: dsmall@well.UUCP
Message-ID: <4535@well.UUCP>
Source record: 255993

In the referenced article, the question is asked: Can the ST under the Magic Sac run TOPS local area network.

We have TOPS here in house, and it isn't compatible with the Magic Sac. As many here on the net already surmised, TOPS talks directly with the SCC in the Mac to achieve high speed. The Atari has no comparable hardware and thus can't be connected. This is also why we've never supported Appletalk on the Magic Sac.

In the referenced reply, Larry Rosenstein at Apple (lsr@apple)
mentions that Apple isn't helping the developers of the Magic Sac,
and so forth.
Larry is absolutely correct. Gads, I wish there *was* someone at
Apple I could ask questions of. There isn't.
I also suspect the rumour that Andy helped us out is one of those legends
that develops from nowhere. He hasn't, though I wish he had.. :-)
Finally, yes, we do detect&fail with copies of Eproms, and yes, the
supply of 64K ROMs is limited. (very). This is one big reason we're
moving to products that don't require said ROMS anymore -- IBM PC cards
and such. We can't have our livelihood dependent on ROM availability,
especially these days.

I have been porting information from an Xt to the St and vice-versa.

You esentially have it correct, but I would only use four connections. Like so

ST Ibm (whatever)
1) ----------- 1)
2) ----------- 3)
3) ----------- 2)
7) ----------- 7)

In this configuration I have been using the same program as you on the Ibm,
and PC Intercomm on the ST, with both in Kermit and 9600 Bps with no problems.
I even use this configuration to port to and from my trusty ole' 8-bit, with
Chamelion on the 8-bit and still at 9600 Bps.

In the referenced article, Dave Hawkins is mentioning our policy towards
upgrades of the Magic Sac (64K -> 128K ROMs).
Dave is running into a problem that's really based in our trying to
explain to users the differences between 64K and 128K ROMS. The big difference
is the HFS file system, which is supported for 64K ROMs (and thus the
Magic Sac) by "Hard Disk 20", a sort of RAM-based HFS patch from Apple.
The other differences, such as zoom boxes, sped-up Quickdraw, rom-resident
routines, and so forth found in the 128K ROMs are not supported by the
Magic Sac. The HFS support is what is meant by "will be made up in software".
We didn't mean to confuse anyone, it's just very difficult to explain
HFS, MFS, and HD-20 to a casual user.
We haven't done any work on a 128K ROM version Magic Sac; our present
efforts are towards IBM PC cards that read/write Mac disks.
I hope this clears up any confusion we might have caused.

In the referenced article(s), there's discussion of the Translator One,
a peripheral that makes Atari drives Mac compatible.
The Translator plugs in "between" the Atari and its disk drive(s).
We say this to try to make clear to many people that it is not a mod to the
Atari drive, but rather a "translator". As it so happens, it can plug
in anywhere on the drive chain, as long as it can sample the read/write
signals. Since the internal drive is also on this chain it can work with
the internal drive as well; I use one on a 1040 in the office.
We use the MIDI ports to send commands to/from the Translator, and can't
loop with other MIDI devices.
The Translator only turns on when a Mac disk is put in the drive; it
is idle otherwise. Hence your drives act like Atari drives until they
need to act like Mac drives. We compensate for the varying speed Mac drives
by varying our read/write clock rate, rather than tweaking drive speed.
I hope this answers some of the Translator questions.

Keywords:Mega's networks

I am in the need of any information concerning the networks that are out for
the ST. The following info is needed:
1. Transfer speeds, and through what port.
2. Limit on the number of ST's that can be hooked together.
3. The amount of distance the ST's can be apart.
4. Info on file servers, printers etc.
5 A rough price for the network based on number of machines.
6. What type of protection is there, passwords, file access, mail.
7. How expandable is the system with other networks like Novell for the IBM.
8. Any pros or cons for or against a network.
The network would most likly be made up of around 15-20 Mega 2's.
One of the main things is being able to set two or three of these networks
and have able to talk to each other. If anyone has some addresses, please
pass them on to me.
Thanx for your help

exclusively. I'm wondering if I should get one of those cleaning-kit
to 'clean' the head of the floppy drive. What's the appropriate thing
to do?
I'm also finally about to purchase a hard-drive. I understand that
the Supra 20Meg comes in two flavors, one which is small (3.5") and another
which is bigger. How are there different? Which is better? Atari SH204
is out; i don't think my dorm desk likes its size.
Has anyone been able to create a file with the 'cat file1 >file2'
command in GULAM? When I do that, file1 just gets printed on my screen, and
file2 is creted with 0 byte.
Also, does anyone know how to fix the mouse problem
that I encounter if I run Publishing Partner in GULAM. Running it the first
time is fine, but if I run it a second time (or subsequently) from GULAM,
the mouse messes up the PP screen (leaves extraneous arrows on screen and
messes up drawing of the menu). PP still runs fine except the screen is
quite messed up. (the kind of thing you get when you did not do mouse_off
when re-drawing a screen where the mouse cursor subsequently leaves a
background block wherever it goes). I've tried doing a mouse_off before
invoking PP, but with same symptoms. This only happens with second and
subsequent runs of PP. Running the first time in GULAM is always fine. Also
after running PP a couple of times (with the messing symptoms), I can exit
to the desktop from GULAM, and re-run PP with no problem at all !!
Am I correct to say that when I exit GULAM, the memory used is not
released.

Your posting indicates that you are changing a machine register in an exception handler without restoring it. This is a no-no in systems programming, at least on the 68000. You don't know what's going on when most hardware exceptions take place, and when the exception handler returns, whatever it was that was taking place tries to continue. If it needs the data in that address register that you clobbered, the system is likely to start doing very odd things.

I suggest reading up on exception handling in a 68000 manual (though the idea is the same as most register machines).

I need some help with the Atari Computer System Interface (ACSI)
level one protocol.

In the developers docs it says "transfer data in 16 byte increment
blocks" [ACSI Application Notes, page 11]. What happens after 16 bytes???
Is the next byte an crc, checksum or something???? Or is the next byte just
the beginning of the next 16 bytes???? On the logic analyzer I just saw a
long stream of DRQ and ACKs with no division after 16 bytes. Is there a header
and/or trailer byte for these 16 bytes or what?

Is there a AHDI Document as referenced in the "Engineering Hardware
Specification of the Atari ST?" If so, I didn't get it. Did anyone
else???? Does it answer any of my questions?

Reply to me or net

Thx

> How does it compare with ICON, available on a Fish Disk?

I'm not really sure ... haven't tried Icon out yet. All I know about Icon is from a July 1986 article in "Computer Language" magazine, and what I've attached below.

My *impression* is that is more well-structured than is SNOBOL4, although the pattern matching capabilities (per se), are a bit more limited. Mike's 2nd comment on this (below) seems to confirm this.

Guess I'll have to tryout Icon and see ... rats, this means yet another book to buy :-)!

BTW, I had misread the note from Catspaw ... it *is* SPITBOL that they are porting to the Amiga (they already have versions available for 680x0 based UNIX(R) boxes like Apollo's, Sun's, NCR Tower, Convergent, etc.)

They also have a port of SPITBOL in progress for the Mac, and are considering a port for the ST (they imply they're looking for a person with the right experience to do such a port, if you're interested).

Oh, and they do have a version of Icon available of MS-DOS machines, too.

A few people emailed me for their address, so ....

Catspaw, Inc.
PO Box 1123
Salida, Colorado 81201

303-539-3884 (voice) [Area code 303 becomes 719 on 3/5/88]
303-539-4830 (BBS)

I've no connection with them, except as a satisfied customer of their SNOBOL4 for my MS-DOS box. They deliver a good product, at a reasonable price, provide good support, reaasonable updates, and of course DO NOT copy-protect their software.

/kim

Unless you're really hooked on SNOBOL as SNOBOL, you might want to
look at Icon (it's on one of the Fish disks).

Icon is what Griswold did after he got tired of SNOBOL. It's got
more powerful string parsing/pattern matching capabilities than
SNOBOL. They're also better integrated into the language.

In reference to your recent posting that Catspaw is working on a port
for SNOBOL for the Amiga, you may be interested to know that the
more recent successor to SNOBOL, the Icon programming language which
was developed at the University of Arizona by Ralph Griswold, one of
the original authors of SNOBOL, is currently available in versions
for MSDOS machines, the Atari, and the Amiga as well as for UNIX. These
are all available from the Icon Project at the Computer Science Dept.
at the University of Arizona in Tucson in both binary and source code
form. They are all public domain and may be obtained for a nominal
fee.

Subject: Re: SNOBOL for Amy
Ultrix: Just say No!
Date: Sun, 22 Nov 87 23:57:51 PST
From: Mike (My watch has windows) Meyer <uunet!violet.Berkeley.EDU!mwm>

If what you want to do in SNOBOL is primarily string and pattern
matching, with little or no processing, you'd be better off with
SNOBOL. Mostly because the pattern matching in SNOBOL is more compact
than it is in Icon.

The reason for that extra compactness is that the SNOBOL pattern
matching is a seperate sub-language embedded in SNOBOL. In Icon, there
are some primitives for scanning part of a string, and operators in
the language for combining these into full-fledged patterns. This
results in 1) pattern-matching facilities that work on things other
than strings - like game trees, or directed graphs, and 2) slightly
more powerfull pattern matching, as you don't have to obey the
restrictions on patterns in SNOBOL.

Those combining operations are "generators" and operators for dealing
with them. A generator is an expression that returns a value, and can

be later resumed to generate a new value, etc.

Examples:

ARB isn't a builtin, but you can write it as a procedure:

```
procedure arb()
suspend &subject[.&pos : &pos <- &pos to *&subject + 1]
end
```

I've forgotten much of my SNOBOL, but you can match the regexp
.*load.*r6.* with

```
arb() || ="load" || arb() || ="r6"
```

|| is string catenation, except that if the right-hand expression
fails, you resume the left-hand expression and then try the right-hand
one again.. It's related to |, which just executes the two expresions.
For instance, if you can print all the integers by doing something
like:

```
n +:= 1 | print n | fail
```

The language is worth a look, but you'll need to buy the book that
goes with it: The Icon Programming Language, by Griswold and Griswold.

>stuff without a wallet transplant.

Just as an example, not an endorsement:

From Skyles Electric Works: MIDI IN, 2 MIDI OUT, and MIDI THRU
for the Amiga.
$49.95 (Amiga 500 and 1000)
$59.95 (Amiga 2000)

It plugs into the RS-232 port.

I think Mimetics also has a MIDI Interface with similar features and price.

Overall, I feel that the Amiga is by far a better computer, and that the 500
should settle and objections as to the price.

Of course, that's only my opinion, unlike the "fact" that the ST has more
support. :-)

>When it was the midi/kboard exception, the results were strange.
>My routine was like this:
> move.l #fc281c a0
> jmp (a0)

If it's any consolation, this is a common mistake made by people who aren't used to writing dirty-tricks code on the 68000. The method you're using to jump to the original exception handler is the problem.

First off, do-NOT use a constant address for the jump. Save the address originaly contained in the exception vector and jump to -that- location. This will allow your code to work on machines where the roms may have changed, and with any other code that may have already "hooked the vector".

Secondly, if you've saved the original vector in a long (4 byte) variable called olvect, use this code to jump to it:

```
move.l olvect,-(a7)
rts
```

This allows you to make an indirect jump without modifying any registers.

Third, be sure you restore the original vector before you exit your program. Not doing so can cause very very bad things to happen.

>The result varied depending on whether I used a0, a1, or a2.

..because altering a0, a1, or a2 had the effect of altering the contents of those registers in-the-program-making-the-exception(!). After your routine changed a0/1/2, the exception handler (doing it's job by-the-rules) would then store and restore the altered values and then RTE to the program running when the exception occured. Remember, never alter the contents of a register from within an exception unless you can restore that register before your code releases control of the machine -or- you're really sure what you're doing.

> Brian Peterson, ...!ucbvax!ucbernie!brianp (brianp@ernie.berkeley.edu)

PS, just out of curiosity, what are you writing that needs to replace an exception vector?

How do SNOBOL and Icon compare to Awk? I did use SNOBOL for a class in
programming, but that was several years ago and I've forgotten it. I haven't
used Icon at all.

For those who don't know Awk, is was written by Aho, Weinberger and
Kernighan (hence its name). The basic outline of a program is a sequence
of pattern/action pairs. As the data file is read, each pattern (regular
expression) is compared to the current line, and the action is executed
if there is a match. The action parts bear a strong resemblance to C,
not surprisingly. As I recall SNOBOL, it was very easy to end up with
spaghetti code. Awk seems to be fairly easy to read. Mr's A., W., and
K. have just published a book about the latest version of Awk, for
those who are interested.

Message-ID: <3025@batcomputer.tn.cornell.edu>
Source record: 255912

[]

I havn't used the linea stuff but use Megamax AL often.
You can access C variables 3 ways:

```
int extint;
func()
{
register int regint;
int intint;
asm {
MOVE regint,... /* access registers by name */
MOVE intint(A6),... /* local vars: name is offset from A6 */
MOVE extint(A4),... /* external vars: name is offset from A4 */
DC.W 0xA001 /* this is how you would stick A_codes in */
MOVE stuff,D0 /* returning a value from a function */
}
}
```

Remember not to change A2-A7/D4-D7 in your asm{} code. A0/A1/D0-D3
are free, A2/A3/D4-D7 are the register variables, A4-A7 are reserved.

Some of that will change in the new version (2.0) of the Megamax compiler.

363. Re: Steve Kaufman's File Transfer Problem (RS-232 stuff)

Newsgroup: comp.sys.atari.st
Date: 1987-11-27 20:43:46 UTC
From: jhs@MITRE-BEDFORD.ARPA
Message-ID: <8711272043.AA14084@mitre-bedford.ARPA>
Source record: 255913

Steve Kaufmann asks why his file transfers don't work. I think the problem lies in the subtleties of the rs-232 standard and in particular the way he has hooked up his Clear To Send (CTS) inputs. Here's my theory...

```
>> AT ATARI KEY (COMMENTS ADDED BY JHS)
>> 1 --------------- 1 1 = GND Grounds tied together, OK.
>> 2 --------------- 3 2 = TX AT sends, ST listens, fine.
>> 3 --------------- 2 3 = RX Vice versa, also correct.
>> 4 --------------- 5 4 = CTS AT is looking for Clear to
>> 5 --------------- 4 5 = RTS*** Send but on wrong line!!!
>> 6 --------------- 20 6 = DTR ? |
>> 7 --------------- 7 7 = GND |
>> 8 --------------- 20 8 = DSR ? |
>> 20 --------------- 6 20 = DCD ? |-- looks OK.
>> 20 --------------- 8 |
```

What makes these terminal-to-terminal connections (remember, a computer is a terminal, a modem is a "DATA SET") so confusing is that the signal names assume we are dealing with a nice, cooperative team consisting of one each terminal and modem. When you go direct between two computers, you have TWO terminals and NO modems. All bets are off. There are two levels of inconsistency that have to be dealt with somehow.

The first level is electrical: you have to make sure that whatever collection of pins you hook up, there is precisely ONE SOURCE and all the rest are INPUTS. As far as I can see, Steve has done that much correctly.

At the next level, you have to make sure that the SEMANTICS of the signals are reasonable.

What appears to me to be wrong is at this second level of subtlety: Clear To Send (CTS) on each side is being fed by Request To Send (RTS) on the other side. (Pin 4 on one side hooked to 5 on the other.) What this means is, if one side wants to Send, it will look for Clear To Send, but this will not be asserted (activated) unless the *OTHER SIDE* is asking permission to send (asserting RTS) at the same time!!! Clearly this is not reasonable. Some other arrangement is needed. When we are looking for Clear To Send, what logic line would the other terminal be asserting that we could look at to ascertain that it was well and truly ready to receive data? And while we are at it, what should we do before we look for Clear To Send?

There may be other variants, but the following should work. When we want to send data, we assert Request To Send. Hook this to Data Carrier Detect (DCD) on the far side. OK, we ask to send, but this comes in on the other side as a signal that the (non-existent) modem just received a carrier. Any reasonable, right-thinking terminal emulator should start getting interested

in receiving data under these conditions, right? We can also hook our Request To Send right back to our OWN Clear To Send so that requests to send are always granted. Or we can feed our Clear To Send with the far side's Data Terminal Ready (DTR) signal, to ensure that a terminal is in fact hooked up and powered up. That's probably the best way to do it. In other words, hook 5 (RTS) on one side to 20 (DCD) on the other, and hook DTR (Pin 6) on the far side back to 4 (CTS) on our side. Probably each Pin 6 should also go to the opposite Pin 8, so that each side's DTR looks like a modem's DSR to the other. I.e. each side's DTR (6) feeds the other side's DSR (8) input and its own CTS (4) input, and each side's RTS (5) feeds the other's DCD (20). I think that will fix Steve's problem, provided that both sides assert DTR without waiting around for something else to happen first.

Then again, "only the electrons know for sure!".

I saw a demo of PC-Ditto on a 520 color system, and it ran Lotus 1-2-3 w/out any problem. Some of the graphics stuff was a little slow, but it ran. An alternative, though, might be VIP Professional. This program is pretty much the same as Lotus. I haven't really used either program (no use), but my (mostly) computer-illiterate boss (a CPA) runs VIP and based on past experience with Lotus and hasn't cracked the book. It also reads and uses existing Lotus files interchangably without any modification. If your friend doesn't already own the Lotus program, he would be being a spendthrift by not going this route as VIP lists for about 1/2 (maybe less) the cost of Lotus...

Try the following:
setenv PATH=d:\bin
setenv SHELL=msh.prg
This works for both make and db. If you want to use gulam instead of msh, use
setenv PATH="directory of gulam"
setenv SHELL=gulam.prg

> The CC command itself works fine under GULAM.
Well, it works - but cc wants me to "hit return". Obviously, cc assumes it
is called from the desktop... I haven't yet figured out that one.

By the way, "pr something >prn:" hangs gulam.

hmmm... This sounds pretty scary to me. If the interface is built into the computer, then the software developers don't have to worry about writing 'drivers' to support all the different interfaces with 'similar features'. However, if you have to hook the interface up as an afterthought, only the software supplied by the interface manufacturer may be compatable.

The MIDI port is already there on the ST, so the musician who wants to become 'computerized' can just go buy an ST, and just any piece of music software, and he's ready to go. This guy's gonna have enough problems trying to figure out why the program won't do the same things to his Juno-106, that it does to his Yamaha DX-7 (?). He really shouldn't have to worry about why the progam won't talk to either of them (read: why the program wont talk to the interface.).

According to an article in the November issue of ST Applications, VIP is
compatible with version 1a of Lotus, and lacks many of the features of version
2.01. They had an interesting feature comparison chart for 6 ST spreadsheets,
which included Lotus and Excel for comparison. I think anyone wishing to buy
an ST spreadsheet should consider looking at this article.

368. The ACSI interface

Newsgroup: comp.sys.atari.st
Date: 1987-11-28 18:57:43 UTC
From: crash@calgary.UUCP
Message-ID: <1230@vaxb.calgary.UUCP>
Source record: 255918

I believe I've answered my questions about the 16 byte transfers.
I was in a very narrow scope, thinking that the dma port was only for
hard disks at the time of my panic. Of course, anything can attach to it,
and you must send at least 16 bytes or multiples there of.

All this was in reference to the external ramdisk. Work is progressing,
the first version will only support the atari interface. If it proves popular
I'll do a full SCSI implementation. Confirmed details of the project are:

o The custom chip will support upto 16meg
o The first prototype circuit boards will support
upto 2 meg using 256K x 1. (there cheap and easy to
get)
o The circuit board will have buffers for the bus

I intend to market this at the hobbyist level first. Thus if you just want
the chip (and docs) you can get it. WHEN??? SPRING hopefully. My
first priority is my thesis!

Gee, that's a hefty list of newsgroups. I promise not to do it again.

Summary: I've used Snobol, AWK, and Icon. I don't use Snobol or AWK any more.

Reason: versus Snobol - Icon is structured: it has local variables, and
so on. It feels much more like a conventional language, without giving
up (much) in the pattern matching side.
Versus AWK: more powerful - more data types, more constructs.
Versus both: zippo features like generators (a language construct based on
coroutine execution). Separate compilation and linking - essential for
any large effort, and fast enough to be OK for those five-liners. Also,
this allows you to link in programs written in other languages, hence,
reuse previsous code, or do any obscure system calls.

My experience: I've booted two successive Icon distribution tapes, each on
both a Vax (4.2BSD) and a Sun-3. No sweat. Fast enough compilation for short
quickies, fast enough execution for munging big input files. One bug found:
Arizona gave me a writearound very quickly and fixed it in the next release.

372. 8031 (and other) assemblers for the ST

Newsgroup: comp.sys.atari.st
Date: 1987-11-29 04:31:08 UTC
From: jpexg@mit-hermes.AI.MIT.EDU
Message-ID: <2886@mit-hermes.AI.MIT.EDU>
Source record: 255922

A couple of months ago someone asked if an assembler for the Intel 8031/51 was available for the ST. I clipped an ad from Electronic Engineering Times for such an assembler; it's not public domain (which the original poster wanted--sorry!) but it does have 20 different processors all in one program, including Z8, Z80, 8096, 8048, 6502--all the common ones.

The ad claims "Generates Intel hex, Motorola-S and binary output".

Cost is $299 for the ST or Mac, or $199 for the PC. An asterisk by the ST listing leads to the note "Includes EDITOR and Communications Software with C source code". Does this mean that they did the development work on an ST?

The midi "interface adaptor" for the amiga consists of:
a DB-25 plug, a DB-25 socket, 4 DIN sockets, 2 toggle switches,
an optiosolator, and an op-amp.

In other words, the only thing not already MIDI about the port on the back of the Amiga is that it's a DB-25 instead of a DIN. The op-amp and optoisolator just make it safe (i.e. buffering). But as far as software is concerned, ANY midi "adaptor" for the amiga will look the same.

The DB-25 socket and one of the switches are so the person can use his printer too. Yeah, it would be nice to have a seperate, dedicated MIDI jack, but a) you usually never print while MIDI-ing, and b) many people will never use their Amigas for MIDI, so it would have been wasted money.

A friend had shown me a copy of a magazine article on "how to build a MIDI adaptor for the Amiga." Does anyone remember what magazine/issue that was?

David Carter

374. AT<-->ST null modem

Newsgroup: comp.sys.atari.st
Date: 1987-11-29 16:16:33 UTC
From: daemon@stag.UUCP
Message-ID: <265@stag.UUCP>
Source record: 255924

I send files back and forth between an ST and an IBM-PC quite often. I assume the AT isn't all that different. It DOES* have a "standard" rs232 serial port, right? So, the null modem I use has more connections that I usually need, but always seems to have the right ones for many varieties of computer<-->computer (ie. no modems) connections. It's wired like this:

```
1-------------1
2-------------3
3-------------2
4-------------8
5--/
8-------------4
\--5
7-------------7
6-------------20
20------------6
```

I hope this helps. BTW, I bought the null-modem pre-made.

Source record: 255925

juancho@dgp.toronto.edu (John Buchanan) writes:
> A proposal for extended argument passing is floatting around
> Instead of forgetting about it lets adopt it. You ask how? This is how.
> First Atari will endorse it and fix their compilers so that they support
> it, then They will release free roms that fix this and other bugs, then
> all the software houses will adopt it.

Yes, a proposal has been released for passing extended arguments, and
I certainly thinks it should be adopted (I helped write it, so I'm biased).
Atari hasn't officially endorsed it in any way, but you may have noticed
that the standard was approved of and posted by apratt@atari (Allan Pratt).
However, the "how" cited above is not needed. The COMPILER is not the
problem, it's the LIBRARY routines (the _main() function in most cases)
and various command shells which need to change. I'm willing to support
any software house or developer of shells or applications that wants to use
XARGs, by giving source code and/or advice freely. As a matter of fact,
since dLibs (my libraries for Alcyon C) are unrestricted public domain
software, other compiler vendors are free to include any of my routines
directly in their own libraries. It would also be nice if the desktop
(which IS* a command shell of sorts) passed extended arguments, but that
WOULD* require a ROM change (hmm.. how 'bout it Allan?). Obviously, the
new ROMs couldn't be free, but I'd be willing to pay for new ROMs that
fixed some of the GEMDOS bugs as well as added some new features.

376. How to use the comp.binaries/sources.atari.st newsgroups

Newsgroup: comp.sys.atari.st
Date: 1987-11-29 17:54:12 UTC
From: turner@daisy.UUCP
Message-ID: <679@daisy.UUCP>
Source record: 255926

```
Introduction:

This document outlines the purpose of comp.sources.atari.st and
comp.binaries.atari.st; how to 'unpack' postings; and how to submit files
to the groups for posting. These groups are moderated by me in my copious (:-)
spare time and turn around may be a little slow. Don't be afraid to send me
mail asking me what the ^$%# happened to your submission. Every program
submitted to me is tested to the best of my abilities and hardware. If I can
not fully test a submission, because I don't have appropriate hardware or I
don't know the language being used, I will put a caveat in the posting
warning the user to that effect.

Purpose:

The moderated groups were created to lessen the traffic created
by multiple postings (as in: I lost part n, could someone repost it)
and to provide a relatively reliable posting. To that end I download
every posting; compile it (if appropriate); test it; document it (if
necessary); checksum it; repackage it; locally post it; unpackage it
and recheck the posting; and finally post it to the net. This process
is fairly time consumming and therefore frustrating to the poster
who would (very reasonably) like to see their posting see the light
of day as soon as possible; have patience !

Contents:

Each posting consists of the following parts:

Subject line with usage information
Editor's note
checksums
the posting

1. Subject line

The subject line consists of a 3 field code which gives
some information on the contents of the posting and a
quick summary of what is in the posting. The 3 fields are
seperated by ':'s and may in turn contain subfields
seperated by ';'s. The first field is a 3 digit code that
describes the language in which the posting is written.
Some examples are:

bin - the posting is a binary (executable) only
mwc - the posting is written in Marc Williams C
mmc - Megamax C
drc - DRI (Alcyon) C
```

bas - basic
pps - Personal pascal
dra - Alcyon assembler
mwa - Marc Williams assembler
mad - MadCap assembler
pro - prolog
doc - documentation file (no executables)

(I will add more as the need arises)

The second field contains the resolutions in which the program
will run, if it can run in more than 1 resolution, then they
seperated by ';'s. The values are:

all - all resolutions
b&w - monochrome
low - low res color
med - hi res color

The third field lists the filters that need to be run to
'unpackage' the posting, that is get it into a format that
can be used on the ST. If more than one filter needs to be
used they are seperated by ';'s and listed in the order that
they must be executed. The values are:

shar - Un*x Bourne shell
uue - uudecode
arc - arc
- (empty) posting is usable as is

for example, uue;arc would mean that you must first run the
uudecode program on the posting, then run the arc program on
the output of the uudecode program.

Editor's Note:

This is a (hopefully) quick note from me explaining what the
posting is about, any gotcha's that I found in using it, etc.

Checksums:

These are the checksums for each part (if more than one) of
the complete posting

How to 'unpackage' postings:

The 2 most popular methods for packaging posting are shar format for
sources and uue;arc for binaries. To unpack a shar format simpley
remove the leading headers (usually marked by a line stating 'run
sh on everything that follows...') and trailing signatures and run
the stripped file thru the Un*x sh command (sh filename). This will
unpack and check each file in the shar. If you are not running Un*X
then you need to manually seperate the parts with an editor (what a
pain).

To unpackage a uue;arc submission execute the following steps:

1. look at the line 'begin part ...' in the first (or only) part
and save the file as that filename with the file extension '.uue'
you need not change the file as uudecode ignores everything before
the 'table' line. If the posting has more than 1 part name then the
file extension to part 1 should be '.uaa' and the filename for part
2 'filename.uab', part 3 'filename.uac' etc. For example a 3 part
posting of the gulaam.ttp program would be saved as:

gulaam.uaa
gulaam.uab
gulaam.uac

It should be noted that this is for the 'official' uudecode program
from John-Pierre Dumas that is posted periodically to the group
comp.binaries.atari.st. Other versions of uudecode may be used but
their naming conventions may be different. The other most popular
form of file naming would name the above 3 parts:

gulaaa.uue
gulaab.uue
gulaac.uue

In general the naming convention is only a formality, the basic
format of a uue file is understood by all flavours of uudecode.

2. type 'uudecode filename.uue' for single part postings or
'uudecode filename.uaa' for multiple parts, the other parts will
be automatically linked in.

3. you should now have a file named 'filename.arc' (gulaam.arc in
our example), type 'arc x filename' to extract the pieces of the
original posting.

4. that's it.

The chicken or the egg:

One major problem has been how to post the uuen/decode binaries
without putting them into a uue format. To that end a uudecode.bas
program is periodically posted to the net, this is a 'bootstrap'
version which will decode the uuencode... (you get the idea).
This program does NOT understand anything before the 'begin' line
or after the 'end' statement.

How to submit files:

mail submissions to:

....{decwrl,ucbvax}!imagen!atari!turner

PLEASE include documentation as to what the file contains, how to
use it, etc. If it is a binary file, remember to uuencode it first
as most mailer can't handle binary (non-ascii) characters.

Toolkit:

The full set of programs used in decoding files from the moderated groups are:

uudecode.bas - basic program used to decode the real uudecode.ttp
uudecode.ttp - decode encoding postings
uuencode.ttp - encode binaries for posting
arc.ttp - archive/dearchive groups of binaries files
cksm.ttp - checksum a file

Archives:

At this time, all files posted to both moderated groups are also mailed to ...umix!hyc (Howard Chu) who maintains an archive available to both usenet and ARPAnet. Contact him for more details.

377. Number of ST's out there and GDOS fonts

Newsgroup: comp.sys.atari.st
Date: 1987-11-29 21:20:29 UTC
From: cp78@sdcc15.UUCP
Message-ID: <394@sdcc15.UUCP>
Source record: 255927

Well, I just have two questions.
First, does anybody know the exact number of ST's sold so far? How about that of Amiga?

Second, is there any PD GDOS fonts? Any GDOS font editor? I am using Easy-Draw and would like to have more fonts. Migraph is selling font packages, including 2 fonts, at $30 each. I think that's kind of expensive. Also, is Digas fonts useable with Easy-Draw? Any information will be approciated.

378. Re: SNOBOL for Amy

Newsgroup: comp.sys.atari.st
Date: 1987-11-29 22:32:48 UTC
From: sbw@naucse.UUCP
Message-ID: <509@naucse.UUCP>
Source record: 255928
Cross-posted to:
comp.sys.amiga,comp.lang.misc,comp.sys.mac,comp.sys.atari.st,comp.sys.ibm.pc,comp.sys.apollo,comp.sys.m68k

Just as a comment, the Icon code for SNOBOL4's ARB pattern can be written more cleanly as:

```
procedure ARB()
suspend move(0 to (*&subject - &pos))
end
```

The earlier example was given in the Icon book as a way to use the low-level string-scanning facillities to develop more complex ones.

In fact, if you're willing to burn a little extra cpu time at the end, the suspend given above can be written:

```
suspend move(0 to *&subject)
```

379. STevie ctype.h file

Newsgroup: comp.sys.atari.st

We have the ARCed sources for STevie, the vi-like editor for the ST, obtained from UACE. When we tried compiling them with the Development system, we found that a file which is to be #include-ed was not there. Its name is ctype.h. Could some kind soul please mail it to me? We'd like to get STevie up & running. Thanks in advance!

Marty

From: 870646c@aucs.UUCP
Message-ID: <604@aucs.UUCP>
Source record: 255930

Keywords:CAD 3D 2.02

We I just picked up Cyber Paint from Antic, I must say that the boys have outdone themselves again. I have almost all of the members of the Cyber Family. If you do have CAD 3D 2.0 or 2.02, you should pick up Cyber Paint. Also I have picked up Cyber Control, and again what a program. If you are interested in doing graphics on the ST you should not be without these programs. Also I have finally receive my upgrades to Cybermate and CAD 3D 2.0, and Flash. The upgrades were only the normal fee of $5.00 to cover shipping, I take my hate off to Antic for there first rate customer support.
later
Barry
P.S. Are there any other "Cyber Punks" out there?

381. Safety Seal Reviews (sort of)

<Lions and tigers and... line-eaters?!?>

More news tidbits!

This past weekend (Thanksgiving), I talked to a friend of mine, who is a dealer, and I found some things out.

The new version of pc-Ditto, which works with monochrome, is out. It was shipped last week, and should hit the stores (and theatres near you) soon.

This store where my friend works will be one of the first to receive the Atari laser printer (should be next week). They are going to be... (get this)... $1900! Wow! What an economical price! :-) This dealer told me that the only good purpose for them will be to help persuade his customers to buy the $1400 Epson laser printers he carries ($1900 with extra Meg and a half, plus some other stuff).

He also says that the $5000 repair kits have changed. Now it depends first on what type of dealer you are. His plan with Atari is, they call him every 60 days and ask him what parts, computers, printers, etc. he has in the store for repair, and they send him complete hardware and swap the good for the bad.

Well, I bought Word Perfect! In the first fifteen minutes, I found two bugs. First, I locked up the program when I loaded a non-ASCII file (at least, I think that's what the problem was). The second time, I found that the text cursor in monochrome was always a line above the actual text. My dealer friend says that resizing the window a few times can also mess up WP's idea of page margins. Another dealer I know says that, apparently, WP Corp. never tested WP in monochrome, so most of the bugs only show up then. According to him, if you don't use the mouse at all in monochrome, you should be okay. It's great, I can use the documentation for weight-training. :-)

Music Construction Set (by Richard Plom of Intersect Software) is being distributed for the ST by Electronic Arts. For once, I'm impressed. This program has everything that Music Studio (ugh) had, and more. It's fully GEM-based, for one thing, as opposed to inventing its own interface. The menus all make sense, and you can design waveforms with more flexibility than on Music Studio. MCS lets you put things like vibrato into the voices, and supports MIDI as well. It also comes with a little accessory which, when activated, can load and play MCS songs in the background, while you're cheerfully trashing your GEM Desktop. In fact, the music playing survives even changing resolutions (it's really weird to see that blank screen while the ST does that, and hear music all the time). It does crash, though, if you load a song while inside a program, or if you load one while it's still playing another one.

Alas! that I do not have even one meg in my ST! I got to see some
of the CyberMate demos and now I really would like to be able to run them.

As an aside about pc-Ditto: yes, you can use it on a 520, and it will
run Lotus 1-2-3, somewhat slowly. It also runs dBase III rather well.

I also got to see the blitter in action, finally. Someone mentioned
that there was a demo similar to the flying bird one, but with 5 or 6 birds.
It really flies (ahem!) with a blitter. Shiny Bubbles fairly zips along!

Finally, not a news-bit, but a question. Where are all the Spectrum
pictures coming from? I mean, most of them seem to be digitized, but I don't
think any of the digitizers out for the ST so far have software to handle
that format. Do the folks have an in-house one, or a good conversion program
from Amiga HAM pictures?

382. DCLOCK & IKBD functions

Newsgroup: comp.sys.atari.st
Date: 1987-11-30 05:58:00 UTC
From: JEMCCABE@MTUS5.BITNET
Message-ID: <8711300600.AA16603@ucbvax.Berkeley.EDU>
Source record: 255932

Date: 30 November 1987, 00:47:09 EST
From: Jim McCabe JEMCCABE at MTUS5
To: INFO-ATARI16 at SCORE.STANFORD.EDU
Subject: DCLOCK & IKBD functions

[sigh]

To the kind person who sent me DCLOCK (no need to name names,
especially since I misplaced it anyway... :) -- it does NOT
use the IKBD time functions. Thanks anyway... It looks like
a nice program, I'll try it out on a friend's ST soon (mine
is mono.)

Can someone PLEASE post to the net about how to use the IKBD
functions? The Abacus ST Internals book tempts me with very specific
descriptions of the keyboard packet structures and IKBD commands,
but never mentions how to get them from the processor!
I was glancing through ST Peek's and Pokes (in a bookstore) and
it said that the time is returned in addresses 3584 through 3589.
I tested this out, and it didn't seem to work. Hmm...

There must be someone out there who understands how this works.
All I want to do is read the keyboard time (it's nicer than
GEMDOS's two-second clock.)

And also, please make sure any programs you might send
actually use the IKBD commands before I spend an hour or
so downloading/UUDECODing/unARCing them....

Thanks in advance!

In article <8711250046.AA08976@ucbvax.Berkeley.EDU> goertzel@DCA-EMS.ARPA (Herbert Goertzel) writes:
>Having read the last 3 Info-Ataria16 digests, I saw two messages that purport
>to tell me how to get to these archives from an honest arpanet site. I will
>admit I am not UNIX conversant and / or USENET knowledgeable, but I do know
>how to follow instructions if they are complete. Unfortunately, that was
>not the case in either case.

Assuming a Unix-based host with access to the Internet, and reasonably good access to the NSFnet...

/usr/ucb/ftp 35.1.1.10 <--- This should get you connected to umix.
If you get 'network unreachable' you're
out of luck.
at the ftp 'login:' prompt,
answer 'ftp' (or 'anonymous', they're both the same uid...)

at the ftp 'password:' prompt,
answer with a reasonably intelligible rendition of your name.
(Garbage responses make me unhappy when I review the logs... }-)

at the 'ftp>' prompt,
answer 'cd pub/atari/st' to get to the Atari ST directory. There
are three subdirectories present, named bin, src, and sys, for
files obtained from the binaries, sources, and general discussion
newsgroups. The bin and src directories will both contain two files
named INDEX and INDEX.LONG. The INDEX file contains just the content
of the 'Subject:' field of the original article. The INDEX.LONG file
contains the descriptive text from the original article in addition
to the indexing information of the 'Subject:' article header.

If you've never used ftp before, you should read the man page before doing
any of this. It's also a good idea to issue the 'binary' command as soon
as you log in, (assuming a Unix system, that is) so you'll get all the .ARC
files intact.

Hi,
About a year ago , I started a UniPlus+ * V.2 port for the ATARI ST.
This port was completed in February 1987. However , it needed some hardware assists for UniPlus+ to work at all. The machine had a basic MMU , which consisted of a base and a limit register which only operated in USER mode ; the kernel was mapped straight through. Also , one needed a minimum of 1 megabyte of physical memory , 40 megabytes of disk space , since a full UniPlus+ distribution is about 30 Megs.
Additionally , the company which commissioned the port added a serial multiplexor to the RS232 port . This supported up to 16 additional channels , but could just about cope with 8.
This port was a full UNIX* V.2 swapping port , but for hardware reasons did not support shared memory or read-only text (no MMU protection).
The stack was fixed size (determined at link time) but you could 'sbreak' as much memory as was physically possible.
The port was commissioned by a company in Switzerland . However , the reason that it was not publicised , was that they were only interested in a cheap M68000 board to run UNIX , whilst deliberately omitting the fact that it was an Atari ST machine.They believed that their potential customers would not take too seriously a "business" machine manufactured by a company who specialised in games machines.

keith holder.

UNIX is a registered trademark of AT&T
UniPlus+ is a trademark of UniSoft Systems Corporation.

The above remarks are my own personal beliefs and not that of my company.

and Danish and Swedish and ....
>How about a Gulam which can handle this (or can it, and I just do not
>know how)?

Some months ago someone from Iceland had a major flame on the ignorance of
American (and English) software writers. Apparently it didn't help a bit.
Well, Gulam is great once modified so here is some hints how to modify it.
This is from memory and somewhat unprecise. Mail me if you want more
specific directions.
First you must know that Gulam reinstalls its own key tables after each
command, so there is no way around patching the code.
The reason for this is (I think) that the key tables are defined so function
keys etc. sends char's > 0x80. These char's are then bound to ue functions.
This is sort of described in the Gulam doc's under the command to redefine
key bindings.
Now, the problem is that some of the chars that function keys etc. sends
are national chars.
Therefore first you change all 3 key tables so your "national keys" send
the right char *and* so no function keys etc. sends your national char. You
must of course make the function keys etc. send some other unused char.
Second you must change the key bindings. Note that there are *two* sets
of key bindings and not 3 as stated in the docs, one for *mini* and one
for both *gulam* and other buffers. Also note that chars in the ranges
0x20-0x7f and 0xa0-0xff without any keybinding is default selfinsert, chars
outside these ranges must have the binding 31 (from memory!) to self-
insert.
More specific you need to change the following bindings: For each
national char do: If the char wasn't send by any of the function keys etc.
and if it is in the ranges above you don't have to change anything. If the
char is outside the ranges (or was sendt by a function key etc.) you must
bind the char to 31. If the char previously was send by a function key etc.
this char was bound to some ue function, the char the function key etc. *now*
sends must be bound to that ue function.

The bindings can be changed in two ways: you can use the gulam command to change bindings, or you can patch the code.
The first way is of course the easyest but it has one big problem. The table of bindings for the *mini* buffer is full, so you can make no new bindings in that buffer. There is no problem in the other buffers. You may be able to live with no national chars in *mini*.
If you want to use the second way, you must find the bindings tables in the code. I can not remember the address of the tables but they have a quite destinct format so they are not hard to find (I used DL II). The format is like what you get when you press <help> inside a buffer, and is sort of described in the gulam doc's.

Please, please, please. When the final version of Gulam is done make it easyer for us europeans.

Good luck to everybody,
Jesper

Huh? Wait a minute. The interface is just a hunk of hardware that converts
RS-232 to MIDI current loop. There's no software compatibility problem...
it's just a connector, no intelligence whatsoever. Any program can drive it.

>Amiga. When will Atari learn? All of the television commercials I see
>for Atari are for their game systems, but if they want to change their
>image, shouldn't they advertise their computers? The Amiga commercial

Well, this is somewhat unfair to Atari. The Atari that controls
the video game market is no longer the same company as the Atari that
controls the ST series. They are entirely separate entities. So the problem
at the moment is not one of incorrect advertising, but a lack of advertising.
You're right though, it doesn't help to have all those Atari game commercials
around (even though they aren't related).

No, but I would like to hear from someone who does.

> How about that of Amiga?

Commodore, has said 230K as of June 30 '87 with an estimated 500K by
Dec 30 '87. As recently as last week they said they would have 'no trouble'
meeting that number. Note that they are experiencing heavier than expected
demand for the 2000 because a lot of 1000 owners seem to be taking advantage
of the trade-in policy to upgrade. So that 500K number will include some
extra 2000's which are really 2000 + 1000 owners. But since they only got
to about 150K 1000s out there it won't be a significant number (maybe 20K?)

Well, the information on fonts in the GEM docs are pretty specific,
for once, and barring any errors in those, I hope to write a GDOS
font editor this coming Christmas (oh, sorry, Berkeley calls it a
Winter) Break. Until then, I believe DEGAS Elite has a program
that converts old DEGAS fonts to GDOS format. This is not great,
but it's the only thing there is, aside from $30 for two fonts.

>at the moment is not one of incorrect advertising, but a lack of advertising.

Unfortunately, though you are right in that the VIDEO (coin-op)
game Atari is separate from the ST Atari, the commercials that I've
seen so far have all been for the Atari 7800, or the 2600, or
the 65XE (?). These ARE from OUR Atari, owned and operated
by good ol' Jack Tramiel. So the problem is, when will Atari
get a _*GOOD*_ PR agency? If they could get one like the one
that does ads for Apple, we're set.

398. Sonic Holography.

Newsgroup: comp.sys.atari.st
Date: 1987-11-30 20:42:29 UTC
From: rich@eddie.MIT.EDU
Message-ID: <7536@eddie.MIT.EDU>
Source record: 255948
Cross-posted to: comp.sys.amiga,comp.sys.mac,comp.sys.atari.st,rec.music.makers,rec.music.synth

**** All replies to this message should be sent to
rich@eddie.mit.edu; I do n_t read these newsgroups. I will
summarize and post any info I receive back to the net!

I am a musician/hacker with an interest in sonic imaging (sonic
holography). I am familiar with the Carver sonic hologram generator
and the basic principle used by the device. However, I recently became
aware of some experimental techniques in this area that are based, so
I've been told, on some of same principles used in modern
radarequiptment (E.G. for beam steering). Unfortunately, I forget the
jargon term used to describe the process, but its something like "phase
encoding ... :-)." Does anyone out there have any info on this?

In order to experiment with sonic holography, I would like to
obtain a computer which is suitable for real-time audio
processing. I'm sorta familiar with the Amiga, and less so with the
Mac. The Amiga, as I understand, has a special]purpose chip used
exclusively for audio signal processing, as well as A/D and D/A
hardware in the basic system box. Whatyis the speed and resolution of
the hardware? I was under the impression hhat the sample size is only
8 bits (poor resolution if ya ask me). What is thM?hhardware on the
Mac like?

As I see it, my choice of what system to buy is based on the
following. First, I need a fast processor (at least 1 mip +), I
would estimate at least 1 meg of ram (more is always better), and an
environment flexable enough to facilitate large-scale program
developement (E.G. UNIX or equivalent). Secondly, I am blind, so I
don't want hardware/software hooked to a grmphical user interface
(gimme a good old command-lin5-interpreter like CSH and I'll be
happy). From what I understand, graphical user interfaces are an
integral part of todays music type software (samplers, sequencers
etc.), as well as machines/os's like the Mac and Amiga. Does anyone
know to what extent this is true, and how I might avoid this trap?

Thanx for your help. Any information/comments will be most
apriciated. Please send all replies to me, however, for I don't read
these Newsgroups!!!

399. Colorburst

Newsgroup: comp.sys.atari.st
Date: 1987-11-30 21:08:00 UTC
From: IHLS400@INDYCMS
Message-ID: <8712082256.AA29067@ucbvax.Berkeley.EDU>
Source record: 255949

For those of you who have expressed an interest in Spectrum 512 and
"that other program", I have a copy of Colorburst 3000 from Beery'sBit.
(Not too difficult considering that Andrew Beery works at our local
Atari dealership and is a member of the local user group...)

I still have a lot of things to do and try with it, but in a nutshell,
save your money right now, but you'll probably want to buy it soon.
Colorburst will put 800+ colors on the screen in low res, 200+ on the
screen in medium res. No small feat, obviously. BUT... in the first
release, there are still some bugs in the package and the manual is
(quite frankly) horrid. I was told by Kevin VanHook (who is just now
releasing Comics On Disk), that they did a bit of rushing on the manual,
and it shows. This program will not be for the faint of heart, but it
will do as advertised. With the next release (it's being worked on),
many of the bugs should be history and the manual in a new and improved
form. The good news is that although Colorburst itself is NOT PD,
Beery'sBit has included the source code for the program in the manual
so the user has it available if needed.

I really think that Colorburst will be a terrific addition to your
program library, but wait just a bit longer...

(The cost for the general public is $39.95, if I'm not mistaken.)

If you have any questions, feel free to contact me. I'll try and help.

Do you have a monochrome system and a hippo frame grabber? Perfect!
I've just finished a sexy, GEM based program that features
interractive slider/menu/switch interface, dithering, auto exposure,
time lapse movie recording, and more. Saves in degas pi3 format.

You'll think you have new hardware! Send self addressed, stamped,
bubblepack, and formatted disk to:

Mike Russell/1968 Hopkins St./Berkeley CA 94707

Or, send me e-mail and I'll send you a uuencoded .arc file that includes
object file and documentation. Sorry, won't work with color systems.

>... CAD 3D 2.0 or 2.02...
Precisely what has changed in version 2.02?

> P.S. Are there any other "Cyber Punks" out there?

Yea brother, I too am a true believer. Great Scott, what a system.

Incidentally, those of you with upgraded 520's have a marked
advantage, in that you can hook into your VCR's and create some pretty
impressive videos. (I say upgraded because the program needs a meg).
In fact, (here's a novel use) I used CAD 3-D 2.0 to create
a presentation which I, uh, presented to a baker's dozen of top-level managers
at NCR, at the end of my last co-op work term. Felt a bit like "show and tell"
at first, but it went over pretty well. All co-ops are required to go through
this (incredibly stressful) ordeal at NCR, and it helped to have such a
'crutch.' This was, in fact, the purpose for which I bought CAD 3-D, and the
only way I could justify it to my wife!

The new CYBER CONTROL program (which I haven't got, yet) adds the
ability to use B-splines to twist your objects (and the camera's path) in
amazing ways. The demo I've seen makes me WANT this program.

Add CYBER PAINT, and you've got one incredibly powerful (and expensive,
especially if you add the stereoscopic glasses) desktop video system. The only
problem is that it's practically a full-time job to create anything truly
interesting and of any length. Ask me, I know! The 2 or 3 minutes I created
for my presentation took, oh, maybe 30 to 50 hours (but then, I'm a nit-picking
tweaker, and I needn't have taken quite so long), counting the time spent
creating the objects, such as a true-to-scale 7770 cheque processing machine.

Finally, there are two things which, in my opinion, would add
immeasurably to the system's overall appeal:
A) a 68881 co-processor (someone was just asking about this). CAD
takes two to three ice ages to create complex scenes. If a co-pro-
cessor board were to become popular enough to be considered a de-
facto standard, I'm sure Tom Hudson would support it (the accessory
hook would prove useful here).
B) a higher-resolution video card for the megas (could probably be
done for the ST's as well). Again, a custom accessory could do the
job.

+ ...
+The midi "interface adaptor" for the amiga consists of:
+ a DB-25 plug, a DB-25 socket, 4 DIN sockets, 2 toggle switches,
+ an optiosolator, and an op-amp.
+
+In other words, the only thing not already MIDI about the port on the back of
+the Amiga is that it's a DB-25 instead of a DIN. The op-amp and optoisolator
+just make it safe (i.e. buffering). But as far as software is concerned, ANY
+midi "adaptor" for the amiga will look the same.
+ ...
+David Carter

Actually, I suspect that the op-amp is to make a current loop out of an
EIA (RS-232 style) connection, the opto-isolator is for protection.

MIDI is a serial 5ma current loop with passive receivers, active
transmitters. The op-amp can be used to convert EIA to current loop for
the transmitter, the opto-isolator can be used to read the received data.

I'm not sure how the Amiga printer port is configured, and how the MIDI
devices are accessed from the program, but there are MIDI interfaces on
the market with different features, and this would seem to indicate that
not all Amiga MIDI adaptors are created equal from a programming standpoint.

Does the Amiga OS support MIDI devices? The ST OS does.

A question that must be asked before buying either machine to be part of
a MIDI set-up: Does the software that I want exist for this machine?
If the answer is no, you need to look into whys and whens. Don't let
a bunch of people from either fan club badmouthing the other machine
influence you too much. In most cases, neither party knows of what they
speak.

>
> Rex Jolliff (rex@otto.UUCP, {akgua,ihnp4,mirror,sdcrdcf}!otto!rex)

Let me put Mr. Jolliff's fears to rest. The RS232 connection on the
back of the Amiga (500, 1000, 2000) is connected to a programmable UART
which accommodates a wide range of baud rates including that which MIDI
uses. The Midi interfaces are really just a RS232 to MIDI adapter which
given that there are standards at both ends should no more a problem than
a cable which goes between your printer and your computer. The interfaces
are just a matter of some hex buffers and optoisolators and 'features' like
pass-through or multiple outputs certainly have no affect on what
the program driving the interface sees. A typical interface is very simple
consisting of less than $5 of parts. He certainly could go buy an ST
but if the sole reason is fears of incompatibility from the MIDI interfaces
then he is being misguided by your information and you are certainly doing
him no favors in the department of making intelligent choices.

I will grant that there is more MIDI software available for the ST.
Now that a low cost Amiga has hit the streets I expect the Amiga MIDI
market will probably expand. Rather than start the wars going I will keep
any comparisons of the machines to myself. In the future you might consider,
however, that inaccurate speculation is one of the surest ways to cause
a furor.

>
>-Rich

Rich--

What Dave Carter was saying when he explained the dual use of the serial port for MIDI and lower baud rate I/O was that you can use your serial port for both, just not at the same time. The Amiga serial port already supports MIDI rates, and there is a standard software interface to the serial port. When you buy a MIDI connector you get a MIDI IN, a MIDI OUT, some models provide a MIDI THRU, and a serial port pass-through. These are just connectors and a few inexpensive parts to protect against line surges, etc. You plug the MIDI connectors into the serial port, then your printer into the serial pass-through on the MIDI adapter. The only time you can't use your serial port for printing is while you are using it to send or receive MIDI data, as the serial data destined for your printer would corrupt the MIDI data. There is no need to plug and unplug your printer however; you simply wait until your MIDI I/O is done, then print over the same port. Clear?

>
> Well, this is somewhat unfair to Atari. The Atari that controls
>the video game market is no longer the same company as the Atari that
>controls the ST series. They are entirely separate entities. So the problem

Not quite. The Atari that owns the _home_ video games _is_ the
same Atari that controls the ST series. When Jack Tramiel bought Atari
he sold off the coin-op division of Atari (a company now known as Atari Games)
but retained control of the 2600/5200/7800 game systems as well as the
8-bit computers and now the ST line.

The games systems _are_ selling, and probably outselling the STs,
unfortunately for us ST users. However, what needs to be advertised is
the ST series; the 2600s can sell themselves (I think I heard some figure
that around 100,000 Model 2600 game system units sold in '85 or '86 with
$0 advertising. Now that says something or other about a game image.)

Atari has previously been the leader with graphics (at least with
Jay Miner's work with the 800.) Even some of the arcade games testify to
this: Battle Zone, Tempest, Xevious, Star Wars, Return of the Jedi, etc.
Maybe this 'Abaq' thing will fly; but only if it is unique in some way.
Some nasty fast graphics would be nice; but lets face it: unless Atari
gets something to market (on time) that has something unique about it,
and isn't in the 'game vein', then they always will be 'that damn toy
company.'

>Can a resource file be created on an IBM system and then used by an
>Atari GEM application?

The answer is a qualified yes. Theoretically, any GEM resource
file is compatible with any GEM system, but you should take into account
the fact that some resource information may include a pixel offset, and these
may cause some pains, especially if the source and target machines share
vastly different resolutions.

>Does anyone know where I can buy a resource editor without a new C compiler?

You did not read what he said very well. To summarize:

>> ALL THE MIDI ADAPTORS PRESENT THE SAME PROGRAMMING INTERFACE <<
>> PERIOD <<

The only difference in the units seems to be MIDI THRU, this does not
change the above statement.

With a standard exec device interface (midi.device) it would not even
matter if the hardware *was* incompatible between manufacturer's
devices.

>Does the Amiga OS support MIDI devices? The ST OS does.

Yes, and no. The Amiga OS support works, but provides poor timestamping.

To do it "right" a dedicated MIDI driver must be written. Some
developers have chosen to pick up a solution from the Public Domain,
others have re-invented the wheel. It is not a problem any more
(a long time ago it was).

Unless something has happened real recently that I'm not aware of, the Atari that does the computers is one and the same with the Atari that does the home video games (2600, 5200, 7800). The Atari which does the coin-op video arcade games, like Marble Madness, IS a separate entity, and is known as Atari Games. This division came about when Tramiel bought Atari - he bought the computer and home video sections, but not the coin-op section, which was subsequently sold to someone else.

411. The imperfection of WordPerfect (and how I love it)

Newsgroup: comp.sys.atari.st
Date: 1987-12-01 09:53:42 UTC
From: c9c-eh@dorothy.Berkeley.EDU
Message-ID: <5155@zen.berkeley.edu>
Source record: 255811

<It's them line-eaters. They do *strange* things to a man!>

Imperfect words about WordPerfect...

Okay. First of all, WP for the Atari is version 4.1, as opposed
to the most current version for the PC, which is 4.2. As far as I can tell,
most of the features are the same, and are supported equally well. The
dictionary and the thesaurus are both huge, and contain many words that I
did not expect them to (Berkeley, Oakland, eugene, etc.). The print
program supports 250 different printers already, and you can add your own.
You can print out the parallel port, the serial port, the MIDI port(!), or
to a device file.

However, as good as all that sounds, the program is not without its
share of bugs. The people at WordPerfect have obviously not learned how
to deal with GEM perfectly, and this shows. Here's a list of bugs found
so far, in one night of just messing around with it:

When a menu is dropped down, you can still type, and one character will
overrun your menu.
You can changed the default shape of the text cursor, but if you do, it
screws up the positioning, so it is placed half a line above your
text.
Setting the time and date after you enter the program will not work. It
reported the year as 2028.
Some of the keyboard equivalents to menu commands don't seem to work.
WP will sometimes crash or lock up without any apparent reason. It does
this more often on a monochrome system than on a color one.
Occasionally, WP just will not access a disk correctly. It then pops up
a dialog box which is missing part of its text.
Resizing the window a few times can cause the text to be misplaced, as can
using the speller or thesaurus.
WP and its subsidiary programs may set up a RAMdisk, and will sometimes
exit without deallocating the memory, eating up ~300K.

There are also some minor problems which are not real bugs, but
should probably be fixed:

When doing dictionary searches, the mouse pointer does not turn into a bee
or anything to indicate that it's busy. These can sometimes be
quite time consuming, so it would be more consistent with the
GEM interface (and the rest of the program) to give a more visual
indication of busy-ness.
Some of the Help files seem to refer to IBM keyboards (Page Up and Down,
for example).
The documentation seems to be one revision ahead of the program, as there

are features mentioned in the docs which don't exist in the
program (such as the use of the 6x6 font).
The Goto Shell function is currently unimplemented.
And of course, not everything will fit on one disk. This is one of those
programs that really make it worth having a hard disk (I know,
because mine is at the shop right now).

Of course, on the plus side, I have to say that $99 for such a
package is not bad at all. The documentation is thoroughly written,
professionally typeset, and just brings such a touch of... of... IBM
to the whole thing. Also, the program is just loaded with features that
I haven't even explored yet. It does everything I want, and more.
It's definitely something to look at. Also, it's not as slow as I had
first thought, and it does show the text WYSIWYG, except for right
justification. Plus, once you send in your registration card, there is
toll free support and minimal cost upgrades.

412. CAD packages for the ST

Newsgroup: comp.sys.atari.st
Date: 1987-12-01 13:54:05 UTC
From: cyliax@ea.ecn.purdue.edu
Message-ID: <1122@ea.ecn.purdue.edu>
Source record: 255812

I'm looking for a CAD package for the ST, but don't know what's
available/good out there. I want to be able to create drawings (2D)
of parts and then be able to plot them out at full scale on a plotter.

Some of the features I would like are the following:

- being able to locate coordinates using both inch and metric.
- create object libraries (macros would be OK too).
- being able to define objects by external coordinate lists.
- zoom (look at whole drawing and then be able to magnify areas
and edit them).
- create some kind of intermediate graphics language files.
or be able to write the plotter commands to a file.
- mouse cursor movement/scrolling is a must.
- mouse driven menus would be nice.

Since I don't have a full size plotter at home hooked up to my atari,
I need to be able to upload the a resultant file to a different computer
and plot them.

Please e-mail, and I will post a summary.

Thanks,

> about it?

In Germany there are two companies making a plug in 68881 board. You plug the (little) board on top of a chip and put some connectors somewhere else and presto. I only know the name of one of these companies:
Weide elektronik
Regerstr. 34
D-4010 Hilden
W.Germany
They charge something around DM1000 for it.

The 68881 is memory mapped for its communication so one cannot get the same speed as with the link between the 68020 and the 68881. The 68881 runs at 16Mhz. Most of the time is spent in sending numbers to and from the coprocessor. A good gain can be obtained when special dedicated assembler routines can perform subtasks in the registers of the coprocessor or when many built in functions (sin and cos etc) are used. For a computational program the typical gain is a factor three to four over a software library, but this can run up to a factor 50 for a benchmark like the Savage test.

It will indeed be necessary to do some hacking inside the compilers library as the only software support that is provided with the package is in the form of a set of external routines so that a multiplication is done via c = mult(a,b) rather than c = a*b which is a royal pain in the neck and renders the thing almost useless. A decent hacker has an easy time to disassemble the c/fortran/pascal library of his favourite compiler and replace the appropriate routines by calls to the coprocessor. There are complications though: some compilers don't use IEEE format: Most notably the Mark Williams compiler. Both the Fortran compilers (ProFortran and AC/Fortran (=Absoft)) use IEEE and so does Lattice C. I assume that the ProPascal package also uses IEEE.

Good Luck.

In article <1226@vaxb.calgary.UUCP>, crash@calgary.UUCP (Glen) writes:

> In the developers docs it says "transfer data in 16 byte increment
> blocks" [ACSI Application Notes, page 11]. What happens after 16 bytes???

The DMA controller in the Atari ST series contains two 16 byte deep FIFOs. (In the "programmer's model", this logically looks like a single 16 byte deep FIFO.) This FIFO provides some timing elasticity and also improves performance by buffering byte transactions on the ACSI and turning them into mulitple word transactions on the ST bus. During the course of a normal DMA transaction, the operation on the ACSI bus will appear seamless (i.e. there will be nothing particularly special after each 16 bytes).

In DMA output mode (ST -> ACSI), the FIFO is transparent to the device. When DMA is enabled the DMA chip will (immediately) fill its FIFO and will feed the bytes to the ACSI device as it requests them. Even if the peripheral device requests fewer than (a multiple of) 16 bytes, the fact that there are some bytes "leftover" in the FIFO is not a problem.

In DMA input mode (ACSI -> ST), the FIFO will wait until it has received 16 bytes before it requests the ST bus to actually write the bytes to RAM. There is no way to force a partially full FIFO to be written to RAM, so the peripheral should always generate a multiple of 16 bytes in order to make certain the data gets written. (Note: It is possible to generate multiple DMA ACSI transactions that add up to at least 16 bytes without resetting the DMA chip to effectively pad the data to the next FIFO flush boundary.)

>Dec 30 '87.

And just as interesting and important a question is:

Where are these machines going?
Are most of the ST's going to homes, businesses, or other?
I have heard that most of the Amiga's are going to graphic art shops
rather than homes or traditional businesses.
What types of software sell best on these machines -- home/entertainment
or productivity?
Does anyone know? Does anyone know how I can find out?

Robert Gardner
P.S. I actually LIKE seeing Atari advertising its game systems so heavily.
Maybe I'm crazy, but I sure get upset seeing these computer companies that
finally put together a powerful, usable machine that can have LOTS of
potential benefit for children and home use abandoning the home and
educational markets for the business market. Is it really that bad to
sell to the home and educational markets? Apple abandons the low-end market,
leaving it wide open for Atari and what does Atari seem to be doing?
Abandoning the market...

> Can someone PLEASE post to the net about how to use the IKBD
> functions? The Abacus ST Internals book tempts me with very specific
> descriptions of the keyboard packet structures and IKBD commands,
> but never mentions how to get them from the processor!

The easiest way to get the time/date from the ikbd is to use the xbios to do it for you. The LONG Gettime() function (xbios(23), and the associated settime() xbios(22)) calls will take care of handling all of the communications with the keyboard for you. The Gettime() call will return the time in the low word with the date in the high word. The time and date will be in TOS format.

If you REALLY want to know the least significant bit of the seconds counter you can replace the clockvec pointer that is in the structure returned by the Kbdvbase() (xbios(34)) call. When the "clockvec" code gets control, A0 will be pointing the the ikbd TIME-OF-DAY packet. Your routine should end with an RTS. Once you have installed your routine, the ikbd can be forced to send the time by sending it the INTERROGATE TIME-OF-DAY CLOCK command (0x1c). The easiest way to do that is probably to do Bconout(4,0x1c) bios call, where the 4 refers to the output only KBD device. Be sure to restore the original "clockvec" before your program exits.

> I was glancing through ST Peek's and Pokes (in a bookstore) and
> it said that the time is returned in addresses 3584 through 3589.
> I tested this out, and it didn't seem to work. Hmm...

I REALLY would not recommend using those addresses as they will change from one system release to another.

(If what you want is a relative timer with more than 2 second accuracy, you might consider using the LONG _hz_200 counter that is incremented at a 200 Hz rate and IS located in "defined" system variable space.)

[I wish people wouldn't comment when they don't have the facts.]

In article <1931@chinet.UUCP> dag@chinet.UUCP (Daniel A. Glasser) writes:
>I'm not sure how the Amiga printer port is configured, and how the MIDI
>devices are accessed from the program, but there are MIDI interfaces on
>the market with different features, and this would seem to indicate that
>not all Amiga MIDI adaptors are created equal from a programming standpoint.

Every MIDI interface that I know of on the market for the Amiga uses
the serial port. Some programs like SoundScape, provide their own device
drivers to get the speed up, but the MIDI 'Interface' is nothing more than a
EIA <-> CurrentLoop converter circuit. All of the programs and their
drivers talk to the serial port hardware which is in the same place, and
has the same flag bits as every other Amiga. Thus every MIDI 'Interface'
works with *every* MIDI capable program. There are conflicts when you
multitask two MIDI programs but that is to be expected, one of them can't
get the serial port because the other one has it. This won't be a problem
for a while on the Mac or the ST (or even the IBM-PC for that matter.)

>Does the Amiga OS support MIDI devices? The ST OS does.

The Amiga OS supports any device that has a device driver in
the DEVS: directory. Is there a standardized software layer interface
to a generic midi device (something the Amiga calls a handler), No.

>A question that must be asked before buying either machine to be part of
>a MIDI set-up: Does the software that I want exist for this machine?
>If the answer is no, you need to look into whys and whens. Don't let
>a bunch of people from either fan club badmouthing the other machine

>However, if you have to hook the interface up as an afterthought, only the
>software supplied by the interface manufacturer may be compatable.

A MIDI interface is no more than an opto-isolator and a buffer. All
MIDI interfaces for the Amiga will be the same from a software point of view.
IT IS NOT AN AFTERTHOUGHT !!! The Amiga ROM kernel has ALWAYS supported the
MIDI data rate (somewhere between 31k & 32k baud). The flag for the serial
device is called SERB_RAD_BOOGIE and is documented in the Amiga ROM kernel
manual for vers 1.0!

Incidentally, the Amiga hardware supports serial data rates up to
292000 baud, although it is pointed out that the software may not be able
to keep up with data at this speed. (RKM 1.0 p3-168)

Finally, MIDI interfaces are dead easy to build and only cost about
$12 if you know where to pick up cheap parts (Active Surplus, Toronto;
Halted Specialties, Sunnyvale (I think)) The was an Amazing Computing article
about this just a short while ago. ...sjk

I'm also a fan of the home market, but the business market is where the
business is.(pun intended) Let's face it. Most home users buy a bare bones
system or a mid-size system and wait for prices to drop a bit before buying.
I don't know of many casual users shelling out 700 bucks for a 30mb disk.
Besides, the home market does not buy overpriced service contracts and expensive
software. There is just more money to be made by selling 10 full blown systems
to a business rather than trying to sell 5 systems in a town. Besides, not too
many average people have a need for a computer _system_ whic is usually quite
expensive.

Sorry, but we (Atari Corp) are, in fact, the same company doing the video game advertising. We no longer are associated with the coin-op Atari, but we have the home video game and computer parts.

The reason for the ad policy is simple. We have plenty of game machines and terrific distribution for them. So we advertise heavily. On the computer side, the distribution is not as strong and we're pretty much sold out of product this season. Why advertise if the consumer is unlikely to find the machine available?

It will be interesting to see if Commodore can make a profit on the Amiga's sold this season, after deducting the advertising expense.

From: 870646c@aucs.UUCP
Message-ID: <608@aucs.UUCP>
Source record: 255830

Hi all, well my Mega2 just landed on my desk, really nice. I've got a question for all other Mega owners using the hard disks, I have been using GEMBOOT with my 1040ST all along, when I boot up the Mega two bombs appear then disappear after GEMBOOT has done it's thing. I know that it is the GEMBOOT prg, because when I delete it from the auto folder on the hard disk there is no bombs. I am wondering if this has anything to do with my Mega not having all of it's ROMS installed until the Blitter gets here. Also if big brother(ATARI) is listening could you or someone else answer a question, Has the 40 folder limit been taken care of(botting with GEMBOOT is a pain).

RE: IBM resource <-> ST resource

Nope, the format is not the same due to Intel's low-byte-first-high-byte-second format. However, there is a program for the conversion which I believe posted in CI$ along with the excellent GEM series by Tim Oren(an ex-DRI GEM guru).

Antic sells K-Resource for $49(?) without any compiler. Last time I heard the program has problem with the new ROM but they may have fixed it already.

In the meantime, I am happy using my MMC which comes with a RCS. :-)

You don't have to buy complete new C compiler in order to get a resource
construction program. You could for example buy the Kuma rcp. It won't cost
you $100+.

Apologies if the answer is well-known.
I own an Epson printer, so I am happy. However, I have been asked if
there are any problens putting these nice new 24-pin printers on an ST.
I would guess that for pure text output and normal word processors
there is no problem. However, what about
1. screen dumps
2. word processors including graphics (First Word Plus etc.)
3. desktop publishing systems

Many thanks for any help.
ps. Any suggestions as to the "best" 24-pin printer?

435. PP scientific fonts

Newsgroup: comp.sys.atari.st

From: SYSTEM@UVPHYS.BITNET
Message-ID: <8712030056.AA01825@ucbvax.Berkeley.EDU>
Source record: 255835

Has anyone developed/modified any PP fonts that include sci. symbols and
letters? Are such fonts available commercially or in the PD?
I believe, similar questions have been posted in the past, but I could not
locate the responses.
Any help in locating such fonts will be appreciated.

Thank you in advance,

436. First posting ever, Help

Newsgroup: comp.sys.atari.st
Date: 1987-12-02 18:33:00 UTC
From: MOLCS@UNO.BITNET
Message-ID: <8712021851.AA23508@ucbvax.Berkeley.EDU>
Source record: 255836

This is my first posting!!!

I have a problem...perhaps one of you readers can help...

I have a DEC LA50 printer connected to my Atari 1040 ST and would
like to do graphics dumps. But alas, my printer is NOT Epson
compatible. It uses a technique called SIXEL for printing graphics.

SIXEL is described as follows:

The top 6 verticle dots (first column) of the prnthead are fired according
to the received character. These characters must be in the range 63 - 126
(base 10, ie chars ?..c). The pattern is determined by subtracting an
offset of 63 (base 10) from the received character...
Therefore, sending an "@" (ASCII 64) character yeilds a bit-pattern of
0000 0001 which fires the top pin.
Furthermore: The character "$" (ASCII 36) returns the graphic cursor to
the beginning of the line.
The character "-" (ASCII 45) returns the cursor and advances
the paper by 6 pins.

Graphics mode is entered by sending the printer ESC P q (27 80 113)
and exited by sending ESC \ (27 92)...

I read the article in STart about printer drivers but I did not see an easy
way to add the required offset to the driver...any help in this matter would
be appreciated.

Thanks,
Michael O. Lott

439. OS/9 and other operating systems

Newsgroup: comp.sys.atari.st
Date: 1987-12-03 03:00:21 UTC
From: AB084@DK0RRZK0.BITNET
Message-ID: <8712030211.AA03408@ucbvax.Berkeley.EDU>
Source record: 255839

A few weeks ago I sent a question to the net concerning OS/9.
As far as I could see there was no response to it at all. (Sometimes we seem to miss digests here on BitNet.)
I must admit that the way I put the question didn't make it look very serious. I will try again now, explaining why I'd like to initiate a quite general discussion about operating systems for the ST.

With the ST and in particular with the Mega, Atari succeeds in losing the toy image (gradually). Quite a few STs are used under sort of professional/commercial conditions. But for such purposes one would like to run a more reliable OS on the ST. TOS/GEMDOS, at least in their present state, seem unacceptable.

I'd like to list a couple of points I find important and would expect from a reasonable OS. I invite everyone to comment on it, criticise, support, complete it. And I would appreciate people letting us know which OS's do meet the criteria and which don't. Please let us make use of your experience.

1. A good OS should have very few (favorably no) bugs. It should do what the documentation says, be predictable. No surprises wanted.

2. It should be well documented and function in an intelligible way. It should have a clear concept, e.g. of files, processes, etc.

3. It should be stable. This means it runs for days or even weeks without crashing and it does so even if it is not left alone, if there is somebody working all the time and if this someone makes mistakes.

4. There should be good software available for it or at least become avalilable in the near future. Some kind of compatibility with a "standard" such as UNIX would be nice. It would make porting easy.

5. It should provide (or be integrated with) a modern developing system. Editor, compilers, linker, debugger, make, and so on. All powerful, fast, and easy to use. Compilers should of course generate quick code.

6. Multitasking is a must.

7. Real time capabilities might be useful.

Nice but not absolutely neccessary would be:

8. A TOS/GEM emulator. Don't want to lose all the games. And the few excellent programs (like gulam or uniterm).

Which candidates do I see? Well, there are OS/9 and RTOS-UH. MINIX is being ported and there are even rumours about UNIX. I've read very positive articles about EUMEL (which I have never used or seen at work) in German magazines. There may be more. Hope we'll know soon.

I hope this will be the start of an interesting and useful discussion.

441. Re: Amiga and MIDI

Newsgroup: comp.sys.atari.st
Date: 1987-12-03 06:57:55 UTC
From: dag@chinet.UUCP
Message-ID: <1939@chinet.UUCP>
Source record: 255841
Cross-posted to: comp.sys.amiga,comp.sys.atari.st

In article <35179@sun.uucp> cmcmanis@sun.UUCP (Chuck McManis) writes:
+[I wish people wouldn't comment when they don't have the facts.]

I stated quite clearly that my Amiga knowlege is not extensive.
I have plenty of facts, and don't claim to know anything that I don't know.

+In article <1931@chinet.UUCP> dag@chinet.UUCP (Daniel A. Glasser) writes:
+>I'm not sure how the Amiga printer port is configured, and how the MIDI
+>devices are accessed from the program, but there are MIDI interfaces on
+>the market with different features, and this would seem to indicate that
+>not all Amiga MIDI adaptors are created equal from a programming standpoint.
+
+Every MIDI interface that I know of on the market for the Amiga uses
+the serial port. Some programs like SoundScape, provide their own device
+drivers to get the speed up, but the MIDI 'Interface' is nothing more than a
+EIA <-> CurrentLoop converter circuit. All of the programs and their
+drivers talk to the serial port hardware which is in the same place, and
+has the same flag bits as every other Amiga. Thus every MIDI 'Interface'
+works with *every* MIDI capable program. There are conflicts when you
+multitask two MIDI programs but that is to be expected, one of them can't
+get the serial port because the other one has it. This won't be a problem
+for a while on the Mac or the ST (or even the IBM-PC for that matter.)

The main point of my article, on the technical side, was pointing out
that the op-amp was not being used for protection, but as an EIA to
current loop converter. I have sitting in front of me right now ads
for two different MIDI adaptors for the Amiga, one has four separate
MIDI out's, one has one. For my money, these are different!
Mind you, the same can be said for the ST -- there is only one built-in
MIDI out, and it is harder to add OS support for another serial device.

Multi-tasking? The ST hardware can support some, just not the ST ROM
operating system. I've seen a UNIX V7-like system working just fine.

+>Does the Amiga OS support MIDI devices? The ST OS does.
+
+The Amiga OS supports any device that has a device driver in
+the DEVS: directory. Is there a standardized software layer interface
+to a generic midi device (something the Amiga calls a handler), No.

I was, and am, not attacking the Amiga OS. I was asking a question.

+>A question that must be asked before buying either machine to be part of
+>a MIDI set-up: Does the software that I want exist for this machine?
+>If the answer is no, you need to look into whys and whens. Don't let

+>a bunch of people from either fan club badmouthing the other machine
+>influence you too much. In most cases, neither party knows of what they
+>speak.
+
+This is certainly a true statement, with an example no less!

I WAS NOT BADMOUTING ANYBODY OR ANYTHING!!!! Fully two thirds of the
articles on this topic have been from Amiga fans badmouthing the ST.
I have a full MIDI set up, including an Atari, DX-100, TX81Z,
Midi guitar and some other stuff, and I am under contract to produce
MIDI software for a major music software company. I know about the
Atari. I've read the Amiga manuals and some of the OS source code.
I have not the time or forum to flame the OS on either the Atari
or the Amiga, but suffice it to say that I've used and written
multi-tasking systems with better performance and real-time interprocess
communication and resource management than the Amiga OS in less than
half the space that either machine's OS takes up.

I was giving general advice. If a musician buys a computer for
MIDI and the software is unavailable at the time, he or she must
either wait or write. There are fine packages available on the
ST and PC and Amiga and Mac. Each has its plusses and minuses.
I was advising that what software is available should enter into
the decision, not attacking your precious Amiga!!!!!!!!!!

If you want to attack my qualifications or motivations, post to alt.flame
or send me mail -- I do not like being attacked in any other newsgroup.
I've not attacked you or your machine. I like the Amiga. I don't
like it enough to buy one, but I like it.

I think I have found a bug in the latest version of Gulam.

alias test 'echo $<'

produces a couple of spurious charcters on the input line.

$<%&

The characters are usually above $80. The alpha version didn't do this.
I just delete them by backspacing anyway.

echo $<

by itself works fine.

You might try looking to see if K-Resource is still available (by Kuma Software, who else?). It's been out a long while. It's now available bundled with some of the MetaComCo stuff (in particular the new Lattice C) but I believe that Kuma still do it separately as well. Don't have a clue what it costs, but must be cheaper than a new compiler.

It produces (by switch option) appropriate 'include' type files for C, FORTRAN, and 2 other languages which I've conveniently forgotten -- in addition to the expected .RSC file. Will also produce a 'non-specific structured description' file (they say, I've never tried this) which is alleged to be pretty easy to massage into an appropriate 'include' for any unsupported language you might like.

The documentation is written in a bit of a 'too-folksy' style for my liking, but the program is pretty intuitive to use which makes up for some of that. It does, however, assume that you have some sort of a clue as to what the various resource items/flags mean and do -- it doesn't teach you how to use RSC files or what they mean, but rather gives a handle for making them.

VIP Professional is supposed to be a Lotus clone, and it runs under GMEDOS,
i.e. faster than Lotus would under PC-Ditto. I can't say how good it is, since
I've only seen a friend demonstrate VIP. Looked pretty sharp.

I don't think so! I saw the Magic Sac at COMDEX, and was told that the current version does not emulate 128K Mac ROMs. Specifically, I was told that Hypercard would not run on the Atari using the Magic Sac. This was repeated by an Amiga/Atari dealer here in San Diego.

Also, be advised that you must "obtain" a genuine 64K Macintosh ROM to put into the Magic Sack. Some dealers apparently have them to sell with the Sac.

(BTW, I am a Mac owner who is trying to decide whether to upgrade my 512K, 64K ROM Mac, buy an Amiga, buy an Atari, buy a VAX, buy a tablet of paper and a pencil, or ?)

>>--
>>--->Neil Harris, Director of Marketing Communications, Atari Corporation
>
>

Well, I give Mr. Harris a lot of credit for publicly signing his name to so preposterous/humorous a statement! What does it boil down to? This:

1. We push our game machines because we have a lot of them.

2. We don't push the computers because we don't have a lot of them.

3. Anyway, if we *did* push the computers, people would be really sad because of point #2.

4. We are unconcerned that continued lack of publicity for the computer line may tend to:

(a) preclude winning any new customers, and
(b) dry up whatever interest that has been generated despite Atari's non-existant advertising for the product.

As Dr. Venckman said in "Ghost Busters" to the possessed Sigourney Weaver when the later asked "Do you want this body?", IS THIS A TRICK QUESTION??

Mr. Harris, pardon me, but is it conceivable that you *would* be able to advertise (and sell) more ST's and other Atari computers if you *built more of them*?!

I don't think anyone would blame Atari for advertising their most profitable products. The question that you have raised in my mind is, are you serious about selling Atari computers? If Atari is serious, then produce more units and advertise more vigorously. If you do not feel that that policy is viable, then I have to question why you continue to carry microcomputers in your product line.

In the Unix line of things, the OS called IDRIS has been ported to the ST. I've not seen it, so I don't know how good the port is. As far as I can gather, IDRIS is a Unix look-alike, based on System V, written by Whitesmith's. My Unix friends don't think it's as good as other Unix'es, but it sounds like a good start to me. I've heard that it is being used as a platform for several large programs, but I can't recall what they were. I thought the IDRIS prices were a little high, given the price of the computer and the "power without the price" philosophy of it. I think the full system, with compiler, was over $800. Has anyone on the net used ST IDRIS?

Can anyone tell us more about EUMEL? I've never heard of it.

```
The new release (1.1) is out.
It's TeX 2.1 (2.7 probably next year).
ST-TeX now supports search paths (like the UNIX implementation)
for input, tfm and format files as well as output paths for
dvi, log and fmt output.
It uses `libraries' (similar to UNIX archives) for tfm and font
files, which saves space and time and circumvents the folder problem.
The driver now uses PK fonts (optionally) and supports
EPSON FX, MX, LQ/SQ, NEC P2, P6 and other printers (SLM804 works
since last week and will be included next week or so).
It will also print in landscape mode on most printers.
The driver will utilize the blitter chip (if present) on a mega.
Both TeX and the driver are faster than in the previous release.
The manual is now about 60 pages long, but still in German.
Registered users can upgrade for DM 17.50 per disk (plus postage).
The address is:
TooLs Gmbh

Atari,

I don't buy the excuse that you are advertising vid games because
you have lots of them and are not advertising computers because supply is
low. I say advertise to make the product known.

I think that aside from atari and commodore owners and general
computer enthusiasts, not too many people know how powerful the ST is.
This was almost the case with the Amiga until commode started advertising
it. Unless atari starts to focus on advertising computers, they will be
seen as a vid game company.

Chances are, even folks who do own computers know what exactly the
ST is. This is especially true of _users_ of apple and ibm machines
(probably less so of clones). They might not even read Byte (gasp!).
There must be millions of people out there who think the Macintosh is
the only "turn your home into a home office" machine. Some may even
think that Macs and IBMs are reasonably priced!

Combat system stupidity Atari. ADVERTISE!!!

Neil, I think Bill speaks not only for himself in this
case; many of us here on the Net would agree with him on this
matter. I can definitely see why you're advertising the game

machines; in not a few ways, the biggest market is still in the usual home, where the average person may be more likely to purchase a game system than an ST. BUT... Bill is right. I think that even if you can't get the ST's out the door for the Christmas masses, some advertising surely wouldn't hurt.

I've tried many times in the past to convince others that Atari's image as a game company is now undeserved, a thing of the past. But without some support from Atari to that effect, this claim is usually disbelieved by almost everyone I know, even those who have ST's, in some cases. The problem is not just lack of advertising, it's also that the advertising should be aimed correctly, to convince people that Atari was/is/will be a serious force in the market, and that if Joe Schmoe bought an Atari, he would be able to use it for serious purposes. We want to be able to have corporations using Atari's, too.

All right, that's almost enough said. Certainly, things seem like they might be improving. Some major software houses, such as WordPerfect Corporation (look for my review from a few days ago), are doing things to help. WP is one of those things that I will be able to point to and say "Look. That's NOT a game; it's serious STuff!"

Neil, please listen to us. We are not here to make your life harder :-), we want to help Atari, too. I've always bought Atari, and I probably always will, provided Atari can keep itself in the market.

I am looking for Degas Elite printer driver for a Mannesmann-Tally MT 80 PC printer. The thing is supposed to be Epson compatible, but with the Epson driver it skips a blank line every eight lines, and modifying the settings doesn't seem to help.

If you do not have such a driver (c'mon Germany, you _built_ the thing !) but have the source for the Epson driver, please send it to me and I'll patch it.

Thanks,

Didier.

458. Where did all the blitters go?

Newsgroup: comp.sys.atari.st
Date: 1987-12-04 03:34:52 UTC
From: 870646c@aucs.UUCP
Message-ID: <616@aucs.UUCP>
Source record: 255758

Well the Mega is here but the blitter is not!!!!!!!!!!!! I have talked to Atari and "I will see it in Jan.????????", I have a question for other people in the Canadian market, "How long did you have to wait after buying your Mega before(and if) your blitter showed up?". I know there is problems with the mass production end of things, but it is a REAL DRAG waiting for something that has already been PAID for. I just hope that the people at Atari can get things together soon, I know they are trying. A question to the people that do have them, just how much of an increase is there in graphics?, is there any speed increase in the fills, and line drawing of any noticable degree?
Thanx(sorry to bend your ear)
Barry

459. MWC Make in GULAM Reprse

Newsgroup: comp.sys.atari.st
Date: 1987-12-04 04:00:37 UTC
From: dinolt@wdl1.UUCP
Message-ID: <4120003@wdl1.UUCP>
Source record: 255759

Several weeks ago I posted a request for information concerning the use of the Mark Williams make program inside the GULAM shell. Many thanks to all those 8 people who responded to my query, some with several messages. I am now successfully running the Mark Williams make program from Gulam. I have yet to sort out the time problems also mentioned in that note. Below I summarize what I have learned.

My first question was how to configure the system so that Gulam would run the Mark Williams make. The program would start up but then not compile anything, failing with the error message "No shell".

The problem was fixed as follows:

1.) Remove the SHELL variable from the Gulam environment. (actually I never setenv it)

2.) Make sure a copy of msh is in one of the directories of the PATH,

3.) I also set the environment style to the default gulam environment. I don't think this is necessary but it certainly doesn't hurt.

Several people suggested that I run with a ram disk. I now do this. I have set up the ram disk to contain the passes of the C compiler and space for the temporary files.

My ram disk is F: and I have directories F:\bin and F:\tmp. My PATH environment variable includes F:\bin as well as my ``standard'' places and my TMP environment variable is F:\tmp. This speeds up compilations rather dramatically even over using my hard disk.

Several people asked why I use GULAM instead of the supplied MSH shell. The reasons are as follows:

1.) The GULAM shell looks more like CSH on UNIX that I use at work than MSH does,

2.) GULAM's filename completeion feature is very useful especially in finding names of files when you don't remember all the name,

3.) Gulam conatains a bultin EMACS like editor which comes up instantly when called, can be suspended and returnted to, and has most of the features one wants in an EMACs like editor. It is not as powerful as MicoEmacs 3.? but it is adequate.

4.) The GULAM shell syntax although not completely like CSH seems more natural to me than the syntax of MSH.

5.) GULAM maintains a hash table of all known commands
(.tos, .ttp, .gem, .g files) findable in the PATH
directories. This makes command starting much quicker than in
MSH which must do a physical search of these directories each
time a command is issued.

MSH has several features that GULAM does not, the most important of
them is the notion of ``pipes'' so occasionaly I do run MSH.

The time problem I have is that MSH does not set the time properly.
My hard disk drive controller has a battery backed up clock which is
used to set at least one of the (possibly 3) system clocks via a program
in my AUTO folder. This is fortunately the clock GULAM uses and also
the one used to set the modify dates on files. MSH, when it starts,
has a completely different idea of the time. I did receive several
suggestions of things to try to ensure that msh found the correct
time, but none of them worked.

There is a listing of a demonstration program in the MWC manual which
references the various CLOCKS on the ST. I have yet to get that
program to operate corretly. After I do, I am sure I will be able set
the clocks properly.

To all who resoponed thanks for your help. I hope the above is of some
interest to others on the net.

One thing I noticed about Atari's ST ads (which were shown at the Santa Clara World of Atari Expo last year, and which I haven't seen on TV yet) was that they were all comparisons with other peoples' computers, namely Apple and IBM. We know the ST is a better machine; those ads aren't the way Atari should be pushing their machine. Look at IBM's ads, which show some businessperson in distress, and getting a PC that solves all the problems. That gives people a better reason to buy a computer than, "Yeah, well, my computer COST less than yours, so there." Given a choice between a $1500 paperweight with sound and color graphics (not that the ST is a paperweight, but it might as well be with these ads) and a $2000 business solution, most people would choose the solution.

>
> $99.00 US wow, in Canada they are flogging it for $400.00 cdn.
My local dealer likes to slap the $599.95 CDN "list price" on it and sell it at a drastically lower price. I believe they try for $395, but have frequent sales. I purchased mine for $175. I thought _I_ was getting a great deal. $99 US makes me cry.

>Does word perfect do automatic backups??? I'd hate having the
>program lock up, and thus, losing my work.
I just had to respond to this. I have it doing auto backups every 2, yes 2, minutes to the ramdisk! It gets especially flakey when using multiple columns. For instance, when you're in a multiple-column section, _don't_ use the mouse to position the cursor. It usually dies.
But let me hasten to add that I'm not overly bothered by these bugs, since I figure that in the next update they'll likely be fixed, and in the meantime I have myself one hell of a whiz-bang WP. With the afore-mentioned auto-backup to my ETERNAL ramdisk, I just hit the reset button and the less-than-2-minute-old file is intact. Actually, I keep meaning to change it to 1 minute, since the backup is so fast that you barely get time to see the 'Backing up file' dialog, and thus it's no inconvenience. And during typical editing the program doesn't die too often (for me). It _is_ extraordinarily poor marketing practice to release a product with such obvious problems, but some marketing folks never learn this lesson. One thing _I've_ learned (with this and with dBMAN) is that the more expensive programs are no more free from this affliction than the cheapos. Indeed, it's almost the other way around, since the cheapos are often more simple programs and hence easier to debug.

>People have been asking about ramdisk prototype kit costs,
>less than $100.00 cdn.
Wow yourself. Considering you can populate this with 256K chips, this sounds pretty good! What does this 'kit' entail? Is it a plug'n'go job? My memory fails me. (Pun not intended).

Word Perfect for the Atari ST is $395. For Students/Faculty and such at a university or college, they may get it for $99 by contacting their nearest Word Perfect dealer or Word Perfect themselves and getting a special form. By sending in this form along with proper proof of status, Word Perfect will verify this and mail you a copy for the above mentioned $99. Average turn_around is 2-3 weeks.

Sonic holograms ? Yes, a friend of mine has a Carver as well. Mighty impressive.

I'd be interested in whatever anybody has along these lines for the Amiga.

Plus, there is an audio illusion I've been looking for, for quite a while now. Basically it is an ever increasing tone.

There was a display at the Ontario Science center, ohh, 12 years or so ago, about MC Escher, that had a ball bouncing "up" an ever increasing staircase, with this tone, going up in pitch.

It went up in pitch for the 1/2 hour I stood there. :-)

Any clues ?

So whos usin a serial interface for a printer anyway. What do you
do when you want to use your modem? Disconnect the printer? Spend
a hundred bucks for a switch? Many of the available midi interfaces
for the Amiga have pass thru for the serial port so it can be used
with a modem (obviously not at the same time). Seems to me the question
isnt whether one system has built in midi interface or not (fifty bucks
for an interface isnt gonna break anyone whos seriously talking about
spending the money to get into midi music in a serious way). The question
should be which machine overs the most versatility for various applications.
If we were just talking about buying a machine for music we might as
well buy a Yamaha puter. Obviously offers some of the best internal
voice capability some fine application software. Im sure that there
are all kinds of machines that do one thing better than my AMI does.
I bought the machine because it does lots of things in a way thats
adequate for my needs

> Combat system stupidity Atari. ADVERTISE!!!

Ah, but they ARE advertising the computers. The ratio of ST ads to video
game machine ads I see is maybe 40%/60%; haven't you seen the commercial
for the ST that compares it to the Mac Plus? (The screen is bigger, it's in
color, it has MIDI built in, listen to the music in the background because
it was done on an ST...)

Not the greatest commercial in the world, but it gets the point across. At
least it's better than "The 2600 from A-Tar-Ri!!"

Me, and I thought DISCO was DEAD....

^^^^^^^

We WHO? The owners of Atari ST's? I'm pretty sure that the people Atari is trying to reach with their advertising are NOT aware that the ST is a better machine; hence the advertising to that effect.
If a person has just a layman's knowlege of computers, influenced by advertising, then they're probably going to think that the Mac and the IBM are better machines, 'cos after all, they're advertised more and all the businesses buy them. That's why I think the direct comparison is called for.
As I said in my previous posting, I _have_ seen Atari ST advertising recently, and it hasn't just been price calling (it compares the ST to the Mac+, along very non-technical lines but still making it look good, and then says "So how much more would you expect to pay for all this? How about 50% less?" or words to that effect). I think the commercial is reasonably useful, and perhaps you people are just missing those commercials.

>those ads
>aren't the way Atari should be pushing their machine. Look at IBM's

Hence, as above, the direct comparisons. I stand as before; that is EXACTLY what the commercial I saw above was trying to prove. It was sided for the home market more than the business market, but then the business stuff _was_ mentioned.

I had to reply to this one, I have just purchased a Mega, and it is a very nice machine(love that disk I/O). I see it this way, the ST has just had a face lift for the better(could never go back to a 520/1040), and with the full expansion port on the back who knows what will be out in the next 6-12 months. I still consider the ST a better computer that the Amiga(no war please!), we (as in all of us) need to help push the ST to it's limits(we haven't even start to expand the machine). This is going to take input from all, even more so on Atari's part. The other I meet a fellow that just bought a new IBM clone, he asked what kind of machine I had, when I said a ST he just looked at me as if I spent big $ on a game machine, he was soon updated by me telling him that the ST would run circles around his CLONE. It is this image we need to change!
Thanx for listening
Barry(oh ya!, I speak for myself of course)

469. Hard Disk Optimisers

Newsgroup: comp.sys.atari.st

I suspect that the blitter-less Mega's have all their ROMs installed already. The problem you are encountering with GEMBOOT is that it uses undocumented GEMDOS variables which have moved from version to version of the ROM, and the Megas all have a version of the ROM that have different locations for those variables. It is my understanding that the 40 folder problem has not been fixed in these ROMs, and that you may need a modified version of GEMBOOT.

Maybe someone at Atari can shed a bit more light on this? This is not one of those things which, as Leonard T. likes to say has a "better and legitimate" way to be done -- The 40 folder problem is a very serious problem because it is much more than just that, as has been discussed to death already.

I was at the New York City Audio Engineer Society convention last month, there was a company there which was selling compact disks of "holograms". The demonstration was really impressive. There was definitely a 3D effect especially the haircut thing where they have scissors going around you head and they trim the back with an electric razor. All with a standard CD player and ordinary headphones.

473. Gulam/Publishing Partner/fonts

Newsgroup: comp.sys.atari.st
Date: 1987-12-04 17:05:52 UTC
From: lean@sbcs.UUCP
Message-ID: <859@sbcs.sunysb.edu>
Source record: 255773

Has anyone been able to run Publishing Partner from GULAM for more than once? Whenver I run PP the second time and subsequently (from GULAM), the mouse cursor always messes up the menu & screen. While the program still runs fine, it's very annoying to see the mouse cursor leaving behind patches of black/white blocks whenever it's brought to the menu, or an extraneous dead arrow being left here and there. I run a mono 1040ST. I've tried doing a things like show_mosue, hide_mouse, etc. before invoking PP the second time, but to no avail. This problem doesn't occur when PP is ran the first time (from GULAM). If I exit GULAM and re-run PP, no problem.

To answer someone's question about fonts for PP, SoftLogik puts out Font Disk #1 with Spokane, Thames, and Devoll.
Font Factory (PO Box 17422, Phoenix, AZ 85011. Tel: 602 265-7849) puts out much more fonts. Here're some:
Disk #1) Avant Garde, Courier, Calligraphy.
Disk #2) Times, Helvetica Narrow, 16 bit.
Disk #3) Chancery, Bookman, Chicago
Disk #4) Palatino, Schoolbook, Computer
Disk #5) Dingbats, Symbols, 8 bit
Disk #6) Complete set of 11 laserWriter Plus screen fonts

Palatino looks similar to Times. Symbols include lower/upper case Greek letters, there-exist, for-every, equivalence, contradiction, therefore, etc. All the font disk include printer font and screen font (both color and mono), except disk #6 which I've never seen.

Also, Columbia, University_Roman, Hudson, and Saturn fonts are in public domain, I believe.

477. Megamax 2.0 aka Laser C

Newsgroup: comp.sys.atari.st
Date: 1987-12-04 17:50:07 UTC
From: braner@batcomputer.tn.cornell.edu
Message-ID: <3085@batcomputer.tn.cornell.edu>
Source record: 255777

[]

Just got issue no. 2 of "printf", the Megamax Newsletter,
announcing their "lastest" (sic) product.
Here are the news in brief, and then a few inquiries.

Megamax C version 2.0 (now called Laser C) will be available soon.
If you have Megamax 1.1 you can send your original disks + $20 (a
check made to Megamax), and they will send you the new version
(including the brand new manual) as soon as it is ready.

The changes in new version include:

Better graphical shell, including a "STDIO" window for command-line
die-hards (like me :-) and a "FILER" tool that is friendlier than
the desktop for file copy/rename/delete etc.

A RAM cache that automatically uses the part of RAM that is not
used by the running programs.

A MAKE facility.

No more 32K limits on code segments or extern vars.
(Absolute referencing - bigger, slower code?)
(And what about local vars larger than 32K?)

DRI compatible linker, and faster than the old one.

Some sort of debugging monitor.

Faster and more accurate (read: less buggy) floating point.

My comments:

Can one now adjust the stack size an application gets without
recompiling the startup.c (and rearchiving syslib)?
(I redid the old startup code so that I can now do:
"long _stacklen = 123456; main(){...}")

I have had the opportunity to try out the new FP package.
It is very fast (faster than Absoft FORTRAN).
But did they improve the calling procedures? I.e., is the
C statement "a=b+c; (all doubles) translated to a simple
"jsr _fpadd", or is it still routed through a big jump-table
lookup scheme? With the faster FP package, this can introduce
almost a factor-of-2 slow-down!

If, when debugging a program, the thing locks up and a RESET
is necessary: does the RAMcache (and the latest version of the

source code, if compiled-and-run from the editor, as is now possible) get lost? Since I don't have a hard disk, maybe I'll stick with the trusty RESET-proof RAMdisk.

Disclaimer:

I am not affiliated with Megamax.

Are you sure about that? I just got a new (well, newer than the one I had before) version that works with the new ROMs and supposedly allows 64K resource files to be created (though I've never created a 10K file, let alone a 64K one...) That may be an old version that I just didn't have, though. At any rate, to whoever was looking for resource editors, if you can find a mail order place that still has the Kuma editor, it's worth the money.

>staircase, with this tone, going up in pitch.
>
>It went up in pitch for the 1/2 hour I stood there. :-)

The effect you are looking for is produced by having two tones, one an octave above the other. As they rise in unison, the lower tone slowly becomes louder and the higher one becomes softer, until when they have gone up an octave, the upper tone has completely died out and the lower is where the upper started. Then you bring in a weak tone where the lower one started, and repeat. The ear fools you into thinking it is rising forever.

It might work better with more than two tones at octave intervals, but the idea is the same.

>
> Hi all, well my Mega2 just landed on my desk, really nice. I've got a question for all other Mega owners using the hard disks, I have been using GEMBOOT with
> my 1040ST all along, when I boot up the Mega two bombs appear then disappear
> after GEMBOOT has done its thing.

DO NOT USE GEMBOOT. Use FOLDRXXX from Atari. HINSTALL should be available, too... It makes your hard disk bootable (no "boot floppy" needed).

There are lots of little hacks which work on the 520/1040 but won't work on the Megas. This is because the unpublished locations in ROM have changed (as I've been promising all along). Anything which fools with the system at as low a level as GEMBOOT will probably not work.

FOLDRXXX works because Landon Dyer wrote it with an eye toward ROM-independence. It checks to see what date your ROMs are, and patches the appropriate location in the OS. In the case of the Mega ROMs, he actually added a pointer in the OS header which points to the necessary spot, so FOLDRXXX will work for all future ROM releases.

Even old TOS ROM users should probably not use GEMBOOT... I certainly wouldn't trust it, and with FOLDRXXX and HINSTALL available, you just don't need it.

(HINSTALL may not be as available as I think, but I know it's been on CompUPay and GEnie... Maybe even here. Can anybody tell me (by mail!) if HINSTALL and FOLDRXXX have both appeared on Usenet?)

(a description of Laser C followed, along with a few questions)

I have it from a reliable source that Laser C is not very close to being released, and won't be shipping until February or so. Still, I've sent in my disks as it sounds like it'll finally be a nice development environment for the ST once it does come out.

I would imagine that the editor actually saves the file you're editing then runs the compiler on it -- that is, it LOOKS like it's compiling directly from the edit buffer, but it isn't really. That might mean that code gets saved when it crashes and you have to reboot.

Also, if the new compiler produces DRI-compatible object code, no jump tables should be produced, so you needn't worry about doubly indirect calls to the floating point routines.

A sound that goes up in pitch for 1/2 hour is possible. The human ear has an amazing capacity to detect subtle changes in pitch. I have played around a bit, and gotten tones starting a reletively high(10Khz?) frequencies to go up in pitch for 3+ minutes. My guess is that they really just started at a very low frequency and went up to a very high frequency at some slow rate. If anyone has a bent for such things you can compute the 20hz-20Khz hearing range, into delta-hz/sec, and figure out from some source if the human ear could detect this slow of a change. On the other hand, I might not know what the heck I am talking about.

Source record: 255786
Cross-posted to: comp.sys.amiga,comp.sys.mac,comp.sys.atari.st,rec.music.makers,rec.music.synth

I think the proper name for something that produces a sound that appears to have an ever-increasing pitch is a continuously-rising tone generator. To make one, you create many tones, more or less evenly distributed over the entire audible frequency range. As a component tone rises to a frequency exceeding normal hearing, it is eliminated and replaced by a tone with a frequency that is below the normal hearing range. Since one can't hear the tones being eliminated or added, all one is left with is the impression of continuously-rising tones.

Source record: 255787
Cross-posted to: rec.music.synth,comp.sys.atari.st

I understand that Passport is shipping Mastertracks pro for the
Atari ST, a multitrack Midi sequencer with graphic score editing
capabilities.

I'm very interested in it, especially since it can work with
the standard 'MidiFile' format, according to what I heard.

Has anybody used it yet, and if so :

o Is it reliable and more or less bugfree ?

o Is it copy protected ?

o Can I use it with files on a harddisk ?

o Can I put the program itself on my harddisk ?

o Does it support format 0 and 1 MidiFiles (single track
resp. multiple track) ?

o How much did you pay for it (the store here tries to get
$ 345 a piece) ?

o And, most of all, HOW IS IT ?

Please mail answers to me. I'll summarise to the net.

Well, as an Amiga owner and occasional developer, let me put my two
cents worth in.

Currently, the Atari machines have more software - they have been
around longer and were less expensive. The new Amiga 500 probably are
comparable in price.

The multi-tasking in the Amiga does not neeed to interfer with Amiga
midi performance, although bozo software hacks who have written some
of the currently available Amiga software definitely do interfer with
performance.

The Amiga is somewhat more machine than the ST and probably will be
better for expansion over time. If you just want to buy other
people's stuff then get an Atari or Mac. If you would like to develop
your own software, the Amiga has far more potential - it is a more
difficult machine to program, however.

>
> It went up in pitch for the 1/2 hour I stood there. :-)
>
> Any clues ?

Yup. I saw a film of this back in the 70's. The film was created at
Bell Labs. The effect is easy to reproduce. The bouncing sound
is the sum of several frequencies from 0 - 20 Khz weighted by a
gaussian distribution with the hump of the curve starting at the
lowest frequencies. Now increase the volumn on adjacent frequencies
by sliding the distribution up the scale. Your ear assumes that the
loudest frequency is the one that you heard the last time but
increased in pitched. In fact it heard all frequnecies but focused on
the most predominant (loudest).

As you slide the volumn weights towards the high frequencies the
gaussian distribution wraps around to the low end of the frequency
spectrum and the tone that your ear thought it was hearing (the high
end), fades off into the distance. By this time though it has picked
up the increasing volumn of the lower tones and is following them up
the scale.

Repeat endlessley.

All this time we were watching a film of a ball bouncing up and
Escheresque staircase and feeling like a bunch of laboratory mice.

not to learn all the dates and stuff but so that I could see the
future. Basicly as you have heard many times before "history repeats
itself." This has never been so true with atari.

Back when the atari 800 came out it was intended as direct
compition with apple. They studied the apple and made many
improvements: a better keyboard, better graphics and the
best expansion capabilities I have ever seen on a commersial 8
bit computer. If you have ever taken apart an 800 you will
see that the back of the board has this wicked expansion edge but
was enclosed so that you could not access it. Error #1 - made
a computer that could and should have been expandable but do
to marketing desided to make it rather unexpandable. Then
they took this computer that in my opinion was desided as
a small buisness computer (probably word processing) and turn
it into a game computer. They then said that a nice disk drive
would be available REAL SOON NOW called the 815. They also
promissed a light pen, and several things that I don't remember
anymore. Well the rest is history.

I figure the 815 is comprable to the laser printer or the unix box.

The light pen might be compared to the blitter.

marketing could be compared to marketing.

Boy were my teachers ever right but I didn't think they
were this right and I don't think they thought so either.

There are also many amazing similarities between old atari
and old commodore and new atari and new commodore.

Atari has taken the point of view that making vapor-ware is ok.
Buggy os's are ok.
New products that just look new are ok.
Game machines are ok.

p.s. Sorry Neil I realize that you can't do anything about any of
this, these decisions are made higher up. After all if you could
you would change it right?

495. postscript interpreter??

Newsgroup: comp.sys.atari.st
Date: 1987-12-05 05:08:58 UTC
From: long@sask.UUCP
Message-ID: <954@sask.UUCP>
Source record: 255795

Since a netwide distribution for source code to a public domain postscript interpreter (mostly for a SUN, but...) came out, I would like to know if anyone is thinking of porting this to the ST.

I agree that our on-screen resolution really is pretty crude, but it would be much better than nothing. The way that I see it, I could even dump stuff to my printer, (at 240 dots/inch) and it would still be a very useful tool.

Has anybody got any comments?? Or, better yet, is someone already working on this? I don't intend to get started for a couple months, so I have lots of time to wait for replies...

Warren

I have had the same trouble as you have had. I also have had some replies for fixes. I have replied to them saying "Send me your fix". Noone has responded with something which will help me. Words are nice, but I need some sort of binary which will help me (us.) PLEASE POST THE SOLUTION FOR US. thank you.

It is the pits to have to go thru a GEM boot to run GULAM, when the alpha version did it without any problems.

Has anybody seen the following bug in version 4.14 of Alcyon C?

Neil: Is there a bug list for 4.14? This bug cost me 6 hours to find,
and I've found many others. When is the next rev going to be out?
Will it fix this?

```
/*
* The Alcyon C compiler (Version 4.14) gets confused with the following
* fragment, thinking that "y" in the assignment to F->y (line 10) is of
* type "struct in".
*
* The fault seems to require that the same names be used in the two structs,
* and that the two seemingless senseless compound statements are present.
* (Why put them there? Well this is boiled down from a 300+ line program
* which exhibited the same funnyness).
*
* A fragment of the .s file is shown below
*/
main ()
{ register struct fl {float x, y;} *F;
register struct in {int x, y;} *I;

{
{
I += 2;
}
F->y = F->y - 3.0; /* line 10 */
}
}

------------------------------ produces: --------------------

~I=R12 | yep, they're register based
~F=R13
*line 8
add.l #8,R12
*line 10
move.l #$c00000c2,-(sp) | -3.0
move.l $4(R13),-(sp) | F->y
jsr _fpadd
addq.l #8,sp
move.l R0,-(sp)
jsr _fpftol | Floating Point to Long !
addq.l #4,sp
move R0,$2(R13) | offset looks like "struct in"
| to me
```

499. Where is latest Uniterm? UW? etc.

Newsgroup: comp.sys.atari.st
Date: 1987-12-05 13:10:16 UTC
From: beatyr@pur-ee.UUCP
Message-ID: <7098@pur-ee.UUCP>
Source record: 255799

<<<<>>>>

Hey there Net,
I remember a few people posting articles about the newest versions
of Uniterm (2.0) and Unix Windows (UW) for the ST. I have not yet seen
them and am wondering if I missed them. I have a desperate need for
a much improved, speed-wise, UW and would really like to see the 2.0
ver. of Uniterm.
If I missed them, would someone please mail them to me, I would really
appreciate it.
On another note, I have a Sun 3/50 (soon to be a 3/60) WITHOUT a
display. The reason for this is economics of the university setting - but
my question is to the people at Sun. I have my ST hooked to ttyb and
I heard that NeWS was ported to the ST so that it could act like a display
for NeWS. I also know that there are no commercial plans for it - but I
was wondering if they would allow it to come to Purdue where we have
quite a few Suns - and at least one person that has an ST hooked to one.
Of course I wouldn't let it out of Purdue - but it sure would be nice
to be able to use this ST as more than a VT52 terminal...
Oh well... thanks to all those who could help me out...

Bob B.

500. Atari and Advertising

Newsgroup: comp.sys.atari.st
Date: 1987-12-05 14:23:01 UTC
From: bryan@ihnet.ATT.COM
Message-ID: <586@ihnet.ATT.COM>
Source record: 255800

Just because Atari does not advertise the ST, does not mean
that there will be no Atari ST's sold. After all when was the
last time you saw an ad for Sun Micro Systems in any media ?
The best advertising is not done in magazines or on the tube but
by word of mouth, or through product reviews. The only advertising
Atari should do, is when 1 Million ST systems are sold. When this
happens they ought to rent out some big ship (Like DIGITAL did) and
through the worlds biggest party/show. Also I think Atari should
not sell the Abaq? with the ATARI label on it but with the label
of Atari's Parent company "(TTL) Tramiel Technologies Limited.
I don't think Atari can break in to the Work Station environment
with their "toy/game computer image" which has kept Atari ST's out
of business markets, and stuck in the home/hobby market.

501. RE: Turbocharging the ST

Newsgroup: comp.sys.atari.st
Date: 1987-12-05 15:21:34 UTC
From: dorian@eddie.MIT.EDU
Message-ID: <7585@eddie.MIT.EDU>
Source record: 255651

I received the following message in response to my request for info
about installing a 68010 or -020 in my ST:
+---+

Hi,
I did the software part of the replacement of the 68000 with an
68020 in an ST, and maybe this is a good moment to report our
results. Note that although I have obtained a degree in EE long
ago, I'm not a hardware guru. This was a two person project
(Henk did the hardware stuff, I did the software).

Forget about using the 68010. It brings a lot of trouble without
any significant speed change (expect a few percents due to the
loop mode).

We therefore went straigt to the 68020. We decided to use the
PAK-68 card, as described in c't, august 1987 (a German
magazine). This card replaces the 68000 with an 68020 and
optionally an 68881. The 68020 works with a 16 bit data bus.
Also additional logic is provided for synchronous bus cycles.

As already stated by c't, and confirmed by Atari Benelux, this
board does not work with TOS. Probable cause: timing loops
and weird code (example: build your own stack frame and do an
RTE). The whole thing works with RTOS (a real time os from
Germany, not related to TOS).
Since RTOS is not that cheap, we decided to do some own
experiments first. The following was done:
>From Johan Stevenson, I obtained a beta release of MINIX (thanks
Johan). I made a new bootstrap routine. It worked.
(Ok, it was not that easy, its hard to debug bootstrap routines)

The results were a litte discouraging though.
We only tested with the dhrystone benchmark, as posted on the
net before. Minix/68000 did around 714 dhrystones/second.
This is almost equivalent with the DRI compiler from TOS, but
since both minix and the benchmark program on minix are compiled
with this compiler, this is not surprising.

The results on the 68020 were:
cache enabled: about 769 dhrystones/second
cache disabled: about 515 dhrystones/second.
There is no explanation why the latter result is so much worse
than the 68000 results. The difference with cache enabled and
disabled is about what was expected.
And this is where the story ends...

Henk sold his system, and I did not feel capable enough to find
the cause of this delay. I don't feel that the gain obtained now
is worth the investment in this card.
Any other experiences/results??

By the way: the response from Atari Benelux has always been one
of laughing: what you're trying to do is impossible.
Well, it can be done. Not with TOS, but only with real operating
systems (which use interrupts for I/O instead of timing loops).

Anyway: does anyone know exactly what to do when writing your
own loader for TOS. I know the story in the hitch hikers guide,
but would appreciate some additional info. Anyone?

Oh yeah; about that PAK card. In the november issue of c't they
describe a small card to switch between 68020 and 68000. For
those who want to go to the 68020 but don't want to give up TOS
completely (to play PSION?)

Please reply to the address below, and not to the address in the
header, since this is a shared account. Thanks in advance.

> positive articles about EUMEL (which I have never used or seen at work)
> in German magazines. There may be more. Hope we'll know soon.

> I hope this will be the start of an interesting and useful discussion.

I remember reading a Xenix ad for the ST in a back issue of STart
magazine about a year ago, but I haven't seen any advertisments since
then. Xenix would be a good OS for the ST. With a good
implementation, it should provide multitasking, Unix capability,
reliability, etc. I used to work at a Junior College, and we had a
Tandy 6000 (with a 68000) that ran Xenix. I was surprised at how much
I liked it. The implementation of Xenix itself on that system was
enough to turn a Trash-80 into a serious computer.
If anyone knows anything more about this Xenix, then I would
really like to hear more about it. I haven't been able to find that
ad... By the way, what are the major differences between Unix and
Xenix? After working with both OS's quite a bit, I really haven't
seen any big differences.

503. STevie

My thanks to all who responded.

It seems like there is one unanimous choice for the ST -- that
being EZdraw (or EasyDraw) from Mi-Graph. I am told it is object
oriented and works on a printed page scale.

Other suggestions were Publishing Partner (if more text is desired),
and Nvision (which may be the same as Paintworks).

Thanks again to all who responded.

To: info-atari16@score.stanford.edu

In article <483@tnosel.UUCP> remco@tnosel.UUCP (Remco Bruyne) writes:
>I have a few questions about Publishing Partner:
```

> 1) Are more fonts available than the standard delivered ?

Yes - they can be purchased directly from SoftLogic, or a dealer can
purchase at discount and sell at retail. Clip art (both mono and color)
is also available, in DEGAS format. Included are newer printer drivers,
which require PP version 1.02 to execute properly.

> I always use postscript output; does this have consequences for
> the files you need to use a specific font ?
I don't believe so, since the existing fonts are drawn on the output page,
and not printed as characters.
> 2) Can fonts only be used for postscript output when the laserprinter
> supports the required font or can a font be downloaded ?

One of the newer postscript drivers includes screen fonts for fonts which
exist in the laserprinter's local memory, and a driver which uses the
correct commands to invoke the resident fonts. I do not believe there is
support WITHIN PUBLISHING PARTNER for downloading of fonts, but you might
be able to insert a "header" to the file which would give postscript commands
to remap a font you had already loaded to an existing font, which would then
be called by your PP-generated postscript output file.

> 3) Can text which is routed from column A to column B be un-routed
> (i.e. can all text be put back in column A) ?

Does it still show the "text overflowed" icon at the bottom of the column?
If yes, have you tried changing the point size of the entire column until it
all fits? I do not recall any specific problems here, so this is the approach
I would take in investigating the issue.

Subject: Atari CD-ROM to be shown at Comdex
To: info-atari16@score.stanford.edu

In the Monday, October 26 issue of Electronic Engineering Times there is
an article on page 49 on the new Atari CD-ROM drive which Atari is expected
to show at the Comdex show next week. The half-height drive is slated for
U.S. delivery before the end of the year and may be in the $500-$650 range.
The drive will feature an SCSI-like port that will allow it to link to
both the Atari PC and the ST series and, with slight modifications, other
systems. The drive is being supplied by an unnamed Japaneses manufacturer
and will also have stereo audio playback for use with CD laser-audio disks.
The article also mentions the Apple CD-ROM but gives no introduction date.

Subject: Re: Empire
To: info-atari16@score.stanford.edu

I have a public domain version of Empire...well, at least the listings. I
know the guy who ported Empire to C on the IBM, then took a bunch of his
listings, and moved them to the ST. They worked, but just barely (although
they were amazingly fast...it seems that since Empire took up more than 64K
it ran very slow on the IBM, so on the ST it was blinding.)

Anyway, I was never much of a fan of Empire, so since it still had a few
problems I sort of gave up. If anybody really really wants the listing (to
finish the job) send me mail. The listing is NOT public domain, so I would
first have to ask my friend for permission.

PS - What doesn't work is the "?" command and saving/loading.

> ..ihnp4!meccts!stag!syntel!dal
> (alias: Dalnefre')

The following are the various ways I have seen mentioned to post something:

1. The ATARINET subserver on bitnet has the following three lines in the
index file:

+** ATARINET is a subserver of UH-INFO **
+** Send comments and files for **
+** ATARINET to UACE0 at UHUPVM1. **

Keep in mind that this is on bitnet (so mail would go to
UACE0@UHUPVM1.BITNET). Also, if you post to ATARINET, you
might want to seek out a volunteer with interactive bitnet
access to test the validity of your posted program as it appears
on the server. (Occasionally, ATARINET has a corrupted file
on its public distribution list.)

2. The following message appeared on comp.sys.atari.st a while ago. Note that
all addresses mentioned refer to arpanet, so from a non arpanet site, you
would need to append .ARPA to the end of each e-mail address.

+The Arpanet/DDN archives for the atari are ready for use. FTP to
+RADC-SOFTVAX, and login as GUEST with password GUEST. The current list
+of files is 'atari16/files.doc', GET this file for an updated list of
+what's available. If anyone has a particular program they want, send a
+message to us, and we'll see what we can do. The maintainers of the

+archives are: Rodney Peck (Peck@RADC-MULTICS) and Marc Poulin
+(Poulin@RADC-MULTICS). Enjoy.
+ >>Marc
+--
+ Marc C. Poulin AT&T: (315)336-7564
+ MicroByte Distributors ARPA: Poulin@RADC-MULTICS
+ 6480 Monument Road Archive@RADC-SOFTVAX
+ Rome, NY 13440-7210 CIS: 72737,2703
+--
+ 'Xerox your lunch and file it under "sex offenders!"'
+ -Zippy

3. Score, the machine that info-atari16 flows from/through, also has a
public domain library that is ftp'able. I am not sure how to post to
that archive, but I suggest you send an e-mail message to
INFO-ATARI-REQUEST@SCORE.STANFORD.EDU asking for instructions.

4. LISTSERV@CANADA01 and LISTSERV@FINHUTC are servers that keep track of
info-atari16 articles and I am not sure what all else. I don't use these
because I have never really needed to. Both of them are on bitnet (add
.BITNET to the mailing address). Also, I think FINHUTC is in Europe, so
if your programs will not run on European machines, I would suggest you
not post there.

5. The following article was posted to comp.sys.atari.st not too long ago:

+Article 3933 of comp.sys.atari.st:

+> what does that mean? Where is it? How does on access it? Is it accessible
+> from arpanet?
+
+comp.binaries.atari.st and comp.sources.atari.st are moderated newsgroups
+(by yours truly) for the postings of (i'll bet you guessed) source programs
+and binaries fot the atari st series. If a program is posted by me it means
+that i have tested it (to the best of my abilities), put it into a packaged
+form (arc or shar), unpackaged it just to be sure, checksummed the pieces,\
+and finally posted it.
+
+I am also currently mailing all postings to ...umix!hyc (Howard Chu) who

+has promised to make them available on alternate nets.
+
+other archive sites are INFO-ATARI16 and UHACE, i'm sorry to say that i've
+forgotten the full addresses to those sites
+
+To submit a program(s) for posting please mail to:
+
+....{ucbvax|decwrl}!imagen!atari!daisy!turner
+
+or
+
+....nsc!daisy!turner
+
+If you need copies of arc or uudecode/uuencode to decode the posting, please
+send me email
+
+I hope this helps...
+
+--
+C'est la vie, C'est la guerre, C'est la pomme de terre
+...{decwrl|ucbvax}!imagen!atari!daisy!turner (James M. Turner)
+Daisy Systems, 700 E. Middlefield Rd, P.O. Box 7006,
+Mountain View CA 94039-7006. (415)960-0123
+

I hope you have better luck translating addresses like ...!daisy!turner
than I do. I think these operate for a different network than the one
I am on. In any event, I am pretty sure that turner can be
reached at TURNER@DAISY.UUCP. Please note that
for whatever reason (new job hopefully) Jim Turner seems to be running
a bit behind schedule (i.e. it may take a few weeks from the time you
mail to him until he posts; I assume this is because he is busy but also
because he checks everything that is posted to make sure it works).

Good luck. I hope something is this little note is of some help.

From: sandra@cs.utah.edu (Sandra J Loosemore)
Subject: floating-point format
To: info-atari16@score.stanford.edu

While in the process of trying to find out why my Lisp cross-compiler
wouldn't handle floating point constants properly, I found a goof in
the Alcyon C V4.14 documentation. It claims that, in the Motorola FFP
format, the exponent in bits 0..6 is stored in its two's complement
representation, but in reality it appears to be biased by 64 and stored
as an integer in the range 0..127. Bit 7 is the sign bit and the unsigned
mantissa is in bits 8-31; there is no "hidden bit".

To: info-atari16@score.stanford.edu

[Followups have been pointed to net.lang.c.]

In article <3626@sol.ARPA> crowl@cs.rochester.edu (Lawrence Crowl) writes:
<In article <2262@sfsup.UUCP> mpl@sfsup.UUCP (M.P.Lindner) writes:
<>3. as for the people who say "Never use the basic types", I say the following:
<> 1. use "char" to mean a character or a byte (guaranteed in K&R)
<
<Use char to mean a character. Use "typedef char applicationtype" when the best
<implementation for the intended use happens to be a char on your machine. My
<six bit char may not give the range you assumed because of your chars are
<twelve bits.
<

Sigh. This seems to come up every so often, and generates the same
discussion each time. Why not go right to the end this time?

First, lets discuss sizes. K&R says that shorts are no bigger than
ints, and longs are no shorter than ints. dpANS adds that shorts are
at least 16 bits, and longs at least 32. Since K&R alone allows a
simple a 2-bit typefor short, int and long, it's kind of useless. So
we'll assume the dpANS.

Given those sizes, the "simple" rules are as follows (MP linder got
them right).

1. Use "char" to mean characters, or bytes.
2. Use "short" for small integers which need to be small.
3. Use "int" for small objects for which size doesn't matter.
4. Use "long" for anything that won't fit in 16 bits.

Now, some notes:

1) Never use "char" to hold something being used as an integer. You
have no idea how big it may be on some other machine. Of course, if
something external requires a byte instead of a short for such, you
have no choice.

2) "Small" integers fit in 16 bits. If they don't fit in 16 bits, use long, period.

3) ints should be the fastest type that holds at least 16 bits. Unfortunately, dpANS kept the K&R "most natural" wording, which means there may be environments where ints *aren't* the fastest type.

The above will mean your code ports to dpANS compilers with no problem, except for longs > 32 bits on your machine. Also, if your machine doesn't look like an "ansi" machine (18 bit shorts, say), then you may not be getting the best type for the machine. To avoid that, you can add a level of artificial types between the compiler and your code.

To wit, you create typedefs for "int#" and "uint#". These types are signed (unsigned) ints with # bits of magnitutde. This kind of thing is trivial to do. For instance the following works for most byte-addressed machines with eight-bit bytes:

```
typedef signed char int1, int2, int3, int4, int5, int6, int7;
typedef unsigned char uint1, uint2, uint3, uint4, uint5, uint6, uint7, uint8;
typedef signed short int8, int9, int10, int11, int12, int13, in14, int15;
typedef unsigned short uint9, uint10, uint11, uint12, uint13, uin14, uint15,
uint16;
typedef signed long int16, int17, int18, int19, int20, int21, int22, int23,
int24, int25, int26, int27, int28, int29, int30, int31;
typedef unsigned long uint17, uint18, uint19, uint20, uint21, uint22, uint23,
uint24, uint25, uint26, uint27, uint28, uint29, uint30,
uint31, uint32.
```

Include the file (which should be tuned for your machine, and then declare everything that needs to be larger than 16 bits, or everything for which being small is important, of the type appropriate for it's size. For things that fit in 16 bits for which size doesn't matter, use int. Portability to any architechture that supports the limits you've chosen, and (if the file is set up right) you get the smallest size that works correctly for your application.

Notes again:

1) I chose the smallest size for each that worked. Things for which size matters win this way. Small things that need to be fast wind up as int. So all that's left is things larger than 16 bits that need to be fast. Doing "fint#" and "fuint#" would be possible, but it's not clear how useful such is.

2) Not an int# is # bits of *magnitutde*. Thus, there's no int32 on a machine with 32 bit longs. Likewise int16 needs to be a long, and int8 needs to be a short.

3) I violated the rule about using chars as small integers. But the file is set up on a per-machine basis, and so should be right for the machine you're on.

4) This obviously takes care of machines with odd-sized words not getting the smallest size that works under the simple rules. However, it also helps with the problem of applicatins that really need longs larger than the dpANS minimum, because those types won't exist on machines that don't support them. The resulting code dies at compile time when moved to such a machine, and names the variables that need more bits than they can get. While not as good as running correctly and dieing on overflows, this is much better than producing incorrect results when the "long" would have overflown.

Finally, as Lawrence Crowl notes, you should use typedefs for applications sizes whenever it's appropriate. If you're following the simple rules, this makes it easier to change the code to take advantage of odd-sized words on machines that have them. It leads to more readable code in either case.

The sized int rules are still a win even if everything is typedef'ed to some application name, because 1) the size used by the object is always documented, and 2) all the size-specific types can be fixed by editing one short file.

506. Hard disk boot???

Newsgroup: comp.sys.atari.st
Date: 1987-12-05 21:56:52 UTC
From: 870646c@aucs.UUCP
Message-ID: <624@aucs.UUCP>
Source record: 255656

Summary:Auto booting 204?

Keywords:Hard disk, GEMBOOT

I have a few questions for anyone using a SH204 with a Mega ST. I have a Meag2
with a SH204, I have being auto booting from the hard disk using HDB_V2.3, I
used to be able to auto boot from the floppy when the CTRL,SHIFT, and ALT.
keys were held down, well since I started using the Mega, the machine always
boots from the hard disk with the keys down or up????????????? I am also
using GEMBOOT to overcome the 40 folder limit in TOS(has it been fixed with
the new ROMS). So I thought no big deal I will just kill the boot sector on
drive C when I want to boot a disk from drive a(copy protection is a real
pain in the ass for the owners of hard disks), when I kill the boot sector
the machine will not auto boot from drive "A"?????????? So then I thought
well I will try and run the hard disk driver prg. to get back into the
"C" drive, no good, when I run the driver prg. it tells me that I am using
a set of ROMS not from ATARI, has there been a new driver written for the
SH204 and MEGA? Well to finish it off I ran the boot sector prg. from drive "A"
and reinstalled the boot sector on drive "C", well she boots up fine again
from the hard disk, but no auto boot from drive "A". HELP!!!!

**** FLAME ON ****

In article <4567@pyr.gatech.EDU> gt4785b@pyr.UUCP (David Carter) writes:
>... Yeah, it would be nice to have a seperate, dedicated MIDI jack, but
>a) you usually never print while MIDI-ing, and b) many people will never use
>their Amigas for MIDI, so it would have been wasted money.

First of all, a MIDI interface connects to the serial port, not the printer port. So, although some people have serial printers, the problem is more general than whether you want to print and 'MIDI' at the same time. I have a terminal program running absolutely every minute that my Amiga is powered on (usually 24 hours/day). Because of the Amiga's hard-coded single-serial-port software design, I can not conveniently use MIDI on my Amiga. Even if auxiliary serial ports were available, all Amiga software that does non-trivial serial I/O (including MIDI) uses the built-in port.

The current system of software access to a MIDI device is consistent and works well with any manufacturer's MIDI adapter. The software incompatibility between different MIDI adapters that has been suggested does not exist, since MIDI access is done through the normal serial.device.

The problem is: Amiga system software supports the existence of other serial devices, but does not allow using them to connect a serial printer with a consistent software interface (i.e. printer.device won't work). This means that serial printers can only be connected to the built-in serial port. Amiga communications application software only supports the built-in serial port. This means that modems can only be connected to the built-in serial port. Amiga MIDI software only supports the built-in serial port. This means that MIDI devices can only be connected to the built-in serial port.

The cause of this is mainly that from the beginning, C=A has said to developers: "If you want to do serial I/O, here's what you do: You open the built-in serial-port, set up the parameters...". And that is what the developers did.

I wish the Amiga's software were at least as expandable as its hardware.

In article <3813@trwrb.UUCP> sansom@trwrb.dsd.trw.com.UUCP (Richard Sansom) writes:
>I use my printer all the time with my current MIDI setup (1040 ST, various
>software packages, DX27, TX81Z, TR505). If I had to disconnect my MIDI port
>each time I wanted to print something, I'd go nuts.

A 1040 ST, eh? What does this have to do with the subject "Amiga and MIDI"? Oh, you're saying that it's nice to have a dedicated MIDI device. This is fine, but that does not mean it has to be included with the computer. This

just increases the cost of the system without increasing its usefulness for most people. The Atarioids are always saying that the Amiga costs too much, but are so proud of their built-in MIDI port that increased the cost of their system and will probably never be used.

> Also, what makes you so
>sure "many people will never use their Amigas for MIDI"?

Consider the number of people in this country who use MIDI devices. Let's make a really liberal estimate and say it's a whole one percent of the population. Now consider the people who own Amigas as a sample of that population. Since many people who chose to buy an Amiga did so because of some technical or artistic interest, let's say that there will be a greater incidence of MIDI users, maybe even 5 times as many. Maybe even ten times as many. That still leaves 90 percent of Amigas that will never even be in the same room as any MIDI equipment. Whether that number is "many" is a matter of definition, but it certainly indicates that making those 10% of the users pay for everyone to have a MIDI port is silly.

**** FLAME OFF ****

I think Commodore made a good compromise in providing a general purpose port that can be used for modems, printers, MIDI, and many other things. This minimizes the cost to the users with simple applications, and provides a lot of functionality to the avarage user.

The problem is that the software was not made expandable enough for sophisticated applications. The capability is there, but the software implementation makes things difficult. Note that by "sophisticated applications" I do not mean bizarre uses of the Amiga that its designers never anticipated, nor some "power user" that wants the Amiga to do the work of 25 computers. I mean the sorts of things that people expect from computers these days; things that even IBM-PC's can do. The Amiga is a sophisticated computer, I hate to see it limited in unnecessary ways.

Source record: 255660

Neil,

I've been reading this newsletter for quite a while now, but this is
the first time I've put in my word.

I'd classify myself as an average Atari ST user; I have a basic 520mono
set-up w/ SD drive, an Anchor modem and a Panasonic printer. I like my set-up
VERY much (although I'd like to move up in memory, etc). I bought a basic
Atari 800 about '83 and used it a lot (my father still uses it). I decided
to upgrade with-in Atari because I liked the 800 and the company, and it was
cheaper than a MAC. I always felt the 800 was nearly equivilent to the
Apple II and told all my friends that. Now that I have the ST I do feel it is
equivilent to the MAC (well it COULD be!). Now here's the thing...

There has been much talk for quite awhile about many things that the
Atari Co. should be doing. These comments and suggestions are from LOYAL and
SATISFIED users. This is perhaps the *BEST* market research that could be
done. Not only are most of the users on the net loyal and satisfied, but most
(if not all) are intelligent college students/faculty. WHY NOT LISTEN TO US?

We like Atari and we want Atari to do well just as you do! Please
give us, your users, credit, and use some of the suggestions presented here.
A commercial or two is not going to Bust the Atari Corp. In fact it will
probably do just the opposite! (wouldn't that be nice?) Advertising is an
age-old business...it's been working for a LONG time...why not try some? I'm
sure this is obvious (is it?) but if you advertise, people will buy more
atari's, software writers will be more willing to write for the ST, there will
be more ST software, more people will now buy the Atari because it is
supported, more software will be written, etc., etc., and Atari now out-sells
both Apple and IBM (O.K., maybe I won't push it that far), but you get the
point.

Anyway... you get my drift, Neil. I really like the Atari, and I want
to see it succede (and I want to be able to tell my friends with MAC's where
they can **A-hem**). Please give us something to be proud about! Give us
a company that really does care about its customers! Thanks!

Cross-posted to: comp.sys.amiga,comp.sys.mac,comp.sys.atari.st,rec.music.makers,rec.music.synth

Nic,

I tried this, on a programmable synth, and it don't work.
What you get is kind of a Barber-Pole scale, but I can
definitly recognise the roots. I tried it both starting on
the root and ending on the root, and starting on the root
and ending on the 7th, in the Major, Minor, and Minor Harmonic
Scales.

What does seem to work is simply to use at least 4 seperate
voices to gernerate independent, evenly spaced tones with
increasing frequency. When a voice reaches an upper bound
(the higher the better) set it back to something under 40hz.
Also, non-linear (increasing) functions of freq. vs time
seem to work better, but the programmablity of the synth
hindered me from better exploration of possible functions.

Both of these sounds are intersting. If I ever decide to
learn to program the audio portion of the Amiga maybe I'll
writeup a quicky demo of these effects.

Thanks,

Wade.

515. BMS Boards, IMI drive mechanism, related problems...

Newsgroup: comp.sys.atari.st
Date: 1987-12-07 01:50:16 UTC
From: weaver@tut.cis.ohio-state.edu
Message-ID: <2903@tut.cis.ohio-state.edu>
Source record: 255664

After some delay from BMS on delivering my boards (due to delays on some cables to them) I finally got my BMS boards. And with success: the IMI drives (at least the one of the two I tried) worked. It formatted out to about 15Mb (that was the last I tried) with similar parameters to the Seagate ST506 parameters provided with bmsinit.prg, but with 6 heads and double the amount of cylinders (I think.) However, right now I am using a MiniScribe 20Mb that a friend loaned me (more capacity, smaller, faster.)

I have encountered an interesting problem, however...

After trying to download an archive with Uniterm 1.7b, then trying to download a uuencoded file, Uniterm gives me this nonsense about "Disk Write failed: No space on disk" crap. Well, I think, this is not right; there is only around 2.2Mb on my 10Mb C: partition.

Sure enough, however, on returning back to the desktop and checking with "Show Info", GEMDOS tells me that 0 bytes are available and 2.2Mb are used. What gives?

If you get this mail, respond quickly, I plead. This is finals week at OSU and Thursday 12/10 I depart for my beloved home of NE Ohio :-) If you have any info about this bug, please post or e-mail me. Also, if anyone has TURTLE, the hd backer-upper or HINSTALL, which was mentioned a couple postings ago, *plueeease* e-mail, if possible.

Much appreciated...

<< complaints about midi and terminal sharing same serial port>>

I've used the Amiga midi quite a bit with Deluxe Music Construction Set (verion 1.2 or whatever it is; had to send in an extra $20 for the upgrade and no copy-proof), and with Pro Midi Studio (no offer of a copyable disk). Both DMCS (a true dinosaur) and Pro Midi Studio do a pretty good job of thrashing the CPU.

If you expect to do a good job of time-stamping incoming events, you need to assure very quick response to interrupts from characters coming in from midi. Whith the current sophistication of software, this is tantamount to saying that your midi receive program should be the only user task running. Of course, I suppose you could impose a little priority setting to prevent the terminal emulator from munging the midi timing.

One thing that would be helpful would be to have a midi.device that does the time stamping in the interrupt handler itself. It is my understanding that is or will soon be avialable in Pro Midi studio. Such a device handler would alleviate the need from the controlling program being a hog to assure accurate timing.

There has been a lot of chatter about music-x being pretty neat, but I haven't seen it yet.

Naturally the Atari STs will suffer from the same technical problems with midi response as the Amiga. In the IBM world the soultion has been to use the Korg MPU interface as an outboard solution. Such an outboard solution would probably enhance the functionality of either the ST or the Amiga, but it does cost bucks. I have no involvement with the McIntosh, so I'll leave it out of the discussion for the moment.

Just having a DIN connector doesn't necessarily imply midi functionality. Serious music work requires that connector to have accurate timing. Both the Amiga and ST series have about the same shot at that. The Amgia has more complication, as it has a multitasking O/S that opens up the possiblity of shoving matches twixt programs. If a multitasking (as opposed to desk acessory) version of TOS is released*, it will have the same "problems" as the Amiga requiring programs to be good citizens.

*released meaning that it is announced *and* I can actually purchase it. Of course, both Atari and Commodore know more than a little about the art of vapor ware.

Subject: Filetransfer between Atari and Amiga computers
To: comp-sys-atari-st@ucbvax.berkeley.edu
Keywords: Atari, Amiga, Filetransfer

Hi Everyone!
I've got the following problem, and I was wondering if anyone out there could help me out. My brother owns an Amiga 1000 computer. I work at the University of Amsterdam, where we have 4 Atari computers. Of course, I would like to know if there are programs available in order to enable me to read Atari formatted disks on our Amiga computer at home, and Amiga formatted disks on the Atari's. Does anyone know the whereabouts of such programs (preferably on public domain software) and how to obtain them? Also are there programs for the Atari that 'simulate' an Amiga? There is such a program for the Amiga (to simulate an Atari) :STEmulator.
Please send any Info to : U00254 @ HASARA5.BITNET and not to the sender of this posting. It's not easy for me to obtain the comp.sys.atari postings, so e-mail would be preferred.

Many thanks, Jacqueline (U00254 @ HASARA5.BITNET)

521. Re: Alcyon C Bug N++

Newsgroup: comp.sys.atari.st
Date: 1987-12-07 14:59:48 UTC
From: steven@cwi.nl
Message-ID: <140@piring.cwi.nl>
Source record: 255671

For people interested, here are a couple of bugs in the Alcyon compiler that we've been hitting our heads against for the last few weeks:

1) The compiler doesn't seem able to cope with nested initialisations. For instance, a struct with an array in the middle:

```
static struct foo table[] = {
{ ..... {.....} ......},
...
}
```

The compiler complains about mismatched braces.
Cure: 'unwrap' the struct declaration, so it's all at the same level.

2) In a construct like

```
bar *p = (expression1, expression2);
```

the result of expression2 gets coerced to int, and then back to bar *, meaning basically that you get bombs on the screen when you try to use p, due to a wrong address.
Cure: use

```
bar *p = (expression1, (bar *) expression2);
```

3) We believe that 'complicated' initialisations to auto variables in functions (for instance where the initialisation involves a call to another function) often come out wrong. However, by this point, we despaired, and stopped using the compiler, so we never followed up on it.

I might point out that we're trying to compile a BIG program: 30,000 lines of C, so just trying to trace bug 2 took us a LOT of time.

By the way, just for interest: to compile the lot from scratch, using a ram disk for temporaries would take 4 hours. When we reinitialised the disk partition, and copied the files back, a recompile only took 1.5 hours!

522. Texinfo etc etc etc

Newsgroup: comp.sys.atari.st
Date: 1987-12-07 16:22:54 UTC
From: csrobe@ICASE.ARPA
Message-ID: <8712071622.AA08711@icase.arpa>
Source record: 255672

First, I have received about 30 request for the Texinfo stuff. I have answered almost all (except john@viper.lynx.mx.org -- i have tried several paths and they all bounce; and a handful who sent to #csrobe@wmmvs.bitnet -- it's a prime and the mail facility is an editor + command file == be patient i'll get to you [(**%^$&%*%^#%$ Primos!]).

Second, Texinfo.tex and Texinfo.texinfo should be showing up at

comp.*.atari.st (Thanks, daisy!turner)

and

listserv@canada01.bitnet (Thanks, sofpjf@uoguelph)

please look there (or ask a friend -- i know at least 25 other people have it! :-)

Third, I had to change the font loading in texinfo.tex. You should see several \font=cm... lines that are commented out and replaced with \font=am.... We had to do this, you may not need to. The original was Computer Modern (so i would suggest going with that if possible). If you do take out the \font=am... and replace it with \font=cm..., please not that one line was accidently duplicated \font=cmtt... (i think)! You should be able to find these on your own, but if not, you've been told! Good luck!

>the standard 'MidiFile' format, according to what I heard.
>
>Has anybody used it yet, and if so :
>
> o Is it reliable and more or less bugfree ?

I've had it for a couple of days now. It's _easily_ the best sequencer available for the ST. From what I can tell so far, it is very reliable and only has minor bugs (if you even want to call them that - for example, if while in step-edit mode you add a note which crosses into the next measure and then delete the note, the next measure still shows up in the song-edit window).

> o Is it copy protected ?

Yes. Passport will send a free backup copy to you when you send in your registration, and more backups are available for a small fee. As an aside, I was able to make a backup copy using one of the available copiers for the ST.

> o Can I use it with files on a harddisk ?
> o Can I put the program itself on my harddisk ?

Yes. When you're booting up, you'll need to have the original in one of your floppy drives, though.

> o Does it support format 0 and 1 MidiFiles (single track
> resp. multiple track) ?

Yup.

> o How much did you pay for it (the store here tries to get
> $ 345 a piece) ?

I paid $280 at Guitar Center in Torrance, CA.

> o And, most of all, HOW IS IT ?

Even though I've only had it for a couple of days now, I can state without a doubt (in my mind, at least) that Master Tracks Pro is by far the most professional sequencer available for the ST right now. Passport is said to

be working on a file compatible score editing program to accompany MTP and which will be available some time next year.

I highly recommend this product.

-Rich

p.s. I read a review in one of the Macintosh magazines (MacUser?) which stated (incorrectly) that the Mac version is superior to versions available for "other" compters (the ST, funny how the Mac mags still can't even say the word). Well, after going over both versions in the store, I found no differences between the Mac and ST versions (aside from the obvious cosmetic differences).

p.s.s I've both monochrome and color monitors - use monochrome with MTP!

Agreed. The most important part is doing what the documentation says.

> 2. It should be well documented and function in an intelligible way.
> It should have a clear concept, e.g. of files, processes, etc.

No arguments here either.

> 3. It should be stable. This means it runs for days or even weeks
> without crashing and it does so even if it is not left alone, if
> there is somebody working all the time and if this someone makes
> mistakes.

Your caveat is difficult to achieve. The ST is an unmapped system; the
only memory protection is for the lower part of the address space. If
the OS has code or data elsewhere, it is subject to corruption by an
errant or malicious user program.

> 4. There should be good software available for it or at least become

No arguemnts on any of these points.

> Nice but not absolutely neccessary would be:

> 8. A TOS/GEM emulator. Don't want to lose all the games. And the few
> excellent programs (like gulam or uniterm).

"emulating" TOS, GEM, et. al. would make the "real" OS kinda slow. I would
rather have both OS's on the same disk, with an option to boot either one
at startup time. Ability to read files on the other partition would be
nice, though.

> Which candidates do I see? Well, there are OS/9 and RTOS-UH. MINIX is
> being ported and there are even rumours about UNIX. I've read very

> in German magazines. There may be more. Hope we'll know soon.

What is EUMEL? RTOS-UH? I know of OS-9; I use it at work. I have Idris
on my ST at home. I see that Microware is advertising OS-9 availability
for the ST. Both OS-9 and Idris offer solutions to your above wishes,
although they go about it slightly differently. You would find it easier
to port existing code to an Idris than to OS-9 (my opinion), but its a
great deal easier to customize OS-9 to your specific needs.

Point is that tools exist that address most of your needs.

526. Great Demo from Rex...

Newsgroup: comp.sys.atari.st
Date: 1987-12-07 16:48:00 UTC
From: IHLS400@INDYCMS
Message-ID: <8712082256.AA29083@ucbvax.Berkeley.EDU>
Source record: 255676

I have a request...

Over the weekend a friend gave me a program called LCD.PRG with a file called ERIK.UDO that is a demo program from some company called Rex, if I'm not mistaken. Some people mentioned in the credits are Robb Hubbard and Mad Max, whoever they may be. The demo states that it is DEMO number 3. My friend and I want (HAVE) to know... WHERE ARE NUMBERS ONE AND TWO??????? We MUST have them!! Please! He believes that the program was gotten off a BBS in Canada somewhere, but he doesn't know where. This thing is FUN. It does some slick color shifts and plays music, but the real kicker is that the A drive busy light flashes in time with the music! (Honest to goodness! It's a scream!) When you hit RESET to stop it, there is some digitized applause and a message appears "Thank you for listening, Ladies and Gentlemen." before the system reboots.

If you know where I can find DEMOs ONE and TWO from these people, PLEASE let me know. I could easily be the most popular kid on my ST block with them!

527. All I want for Christmas...

Newsgroup: comp.sys.atari.st
Date: 1987-12-07 16:57:36 UTC
From: csrobe@ICASE.ARPA
Message-ID: <8712071657.AA08820@icase.arpa>
Source record: 255677

Dear [St Nick | Atari | Jack]

I have been a good Atari ST owner for a year and a half now, and
I've even talk 4 of my (ex-)friends into buying STs! I try to help the
ST community by sharing PD software, and making (sometimes) helpful
suggestions to the net. I have even convinced my girlfriend that an ST
(a 1040) is a good machine for the money [I haven't said anything nice
about the Megas, 'cause I can't think of anything nice to say, yet.]

Well, since Christmas time is coming, I thought I might relay
my Christmas Wish List to you. So here goes:

1) A good, well built 2400 baud modem (at a reasonable price
-- $200-$250) that will stand the test of time. [Right,
now the only modem I'd consider is the USRobotics Courier
2400 at $300. I've seen others much cheaper, but I don't
trust them. I've seen too many that are intolerable to use,
and after scanning the modem mailing list, the USRobotics
is the only one that seems to have a consistently good
reputation.]

2) A 68020 ST with Memory Management and GNU or Minix. I have
decided that I like Unix and I (really) like the idea of
being able to recompile the system when I hear about a fix.
I am tired of being at the mercy of a corporation to get
something fixed, buying software that is declared "not
fit for any particular purpose [or whatever]". My machine
is almost totally run by PD software, why not build a good
[hardware] machine and make some arrangement for a OS
distribution like Kyoto Common Lisp. I know its a dead
issue so I'm going to stop here.

3) [This is really wanted I wanted to say]. I want a laptop ST!
I have my ST at home, but I move around a lot, and being
able to carry around part of my ST would be great! Some students
have IBM PC/XT/ATs at home and carry Portables to class for notes
and miscelaneous computing. I would spend $1000 for a good
laptop -- 1meg RAM, a display like the Zenith laptop, a couple
of high density 3.5 inch disk drives, and a built in 2400 baud
modem. I don't need color, I don't need a HD (it would be nice,
but I don't need it), but I do need a modem [if you really
want to be spiffy, make it modular enough so some Business type
can shove a celular phone attachment to it :-)].

Now, i know some of you are going to shake your head at this, but that's ok.
You're supposed to. I just wanted to make known what I would like to see

from Atari. The transputer sounds interesting, but it also sounds out of my price range. I would really like to see a 2400 baud modem, and 68020 with memory management, and a simple-and-sweet laptop. (i'd also like to see the extended resolution monitor, too.).

--chip

PS. Santa, if you can't deliver on the items listed above, I'd settle for MINIX!

528. External Ramdisk In reply to some more people:

Newsgroup: comp.sys.atari.st
Date: 1987-12-07 17:03:55 UTC
From: crash@calgary.UUCP
Message-ID: <1249@vaxb.calgary.UUCP>
Source record: 255678

The prototype kit will be a chip that talks directly to the hard disk port and controls either 256k or 1MEG chips. Also there will be a pcb that sits 256k chips of 1/4 meg increments upto 2 MEG. Basically you add rams, power supply and a case.
It was decided to make the pcb for 256K chips because of availability. I get ten chips back for the first fab.

The design is in progress. The company doing the fab, Alberta Microelectronics Center has a bunch of rules that have to be followed before actual fab takes place, i.e. a dicrete prototype, chip simulation, blah.

One the most costly things of this kit will be a power supply. Seems one of the best things to do is by an Atari power supply. There pretty cheap.

Soon, I will post a spec on the chip. I listened to all who sent mail, thus, I think I'm doing this right. The chip can handle lots of memory, you can still hook up your hard disks, the pcb has hooks for battery backup, and whatever.

Followup to rec.audio, which is where this belongs.

In article <2476@gryphon.CTS.COM> richard@gryphon.CTS.COM (Richard Sexton) writes:
>Sonic holograms ? Yes, a friend of mine has a Carver as well. Mighty
>impressive.

I borrowed one for a test listen. I found that it did make a slight difference in the sound, but only in a very small sweet spot, and not one that was uniformly better for all material. I was not impressed, even given the price of $100 (used).

>Plus, there is an audio illusion I've been looking for, for quite
>a while now. Basically it is an ever increasing tone.

Piece of cake. The trick is to play sine waves at a certain note in all octaves simultaneously. Say you start at A. Then you begin with a mixture of A27.5, A55, A110, A220, A440, A880, A1760, A3520, A7040, A14080 and maybe even A13.75 and A28160 if your equipment is up to it. The relative volumes are higher in the middle and taper off toward the upper and lower registers.

Now, you increase the pitch of each wave slightly, and adjust the volumes so that the lower tones are a little louder, and the upper tones are a little softer, in order to keep the "center of gravity" in frequency space at the same place. Repeat this until you have "gone up" one octave; at this point you can delete the tone which is inaudibly high and insert a new tone an octave below the lowest one. Guess what? You now have exactly the same signal that you began with, and can start over. Repeat indefinitely.

Hi all. Here's my weekly batch of wierd questions.

What if anything has happened w/r/t fixing the dreaded '40 directory' bug? I saw a lot of discussion of the problem and symptoms, but no mention of a fix. I've recently gotten a hard disk, and so am now in a position to get screwed by this bug.

Is there a recent copy of Spacewar available? The one in the archives appears to be mono only (I use color) and the one on UMIX.CC.UMICH.EDU is corrupted; at least neither ARC on my ST nor ARC on a Un*x can read it.

I'm trying to understand the difference between .O files (as produced by C backends, I guess) and executables, ie .TTPs etc. It looks to me like they're the same format (both relocatable) and that the only net difference is that in the executable, all the TEXT psects from the .Os are concatenated together, all the DATA psects ditto, etc, and that references are resolved. If that's true, it seems like the linker's pretty trivial. If not, what am I missing? Also, if my supposition about the linker's true, what's RELMOD for?

Are there any PD debuggers around?

As always, thanks in advance for any info.

533. regarding fonts

534. Atari Repair Centers

Newsgroup: comp.sys.atari.st
Date: 1987-12-07 20:22:53 UTC
From: terrell@laidbak.UUCP
Message-ID: <1270@laidbak.UUCP>
Source record: 255684

My Atari 520 ST is crashed, and I need to get it repaired. Does anyone know if there are any trustworthy factory-authorized Atari service centers in the Chicago area?

Also, what is the telephone number of Atari service?

Also, if I were to send my computer to Atari, will they put in the latest roms? The blitter?

I'm reluctant to send the unit to Atari because when I did this last time it took about 3 months to get it back (Atari was doing inventory, and although the replacement system was packed and ready to go, they refused to let anything out of the warehouse until the inventory was over)!

Thanks in advance,

Eric Terrell

535. Re: OS/9 and other operating systems

> wanted.
The ST version of OS9 has some problems in device drivers that should be
fixed soon. The RS232 port driver for /T1 can crash the system. I have
managed to run with use of /T1 without incident, but others have much
trouble.
> 2. It should be well documented and function in an intelligible way.
> It should have a clear concept, e.g. of files, processes, etc.
The references for the "professional" version of ST-OS9 are complete and
correct as far as I know. OS9 is well known for a very "robust" file
system.
> 3. It should be stable. This means it runs for days or even weeks
> without crashing and it does so even if it is not left alone, if
> there is somebody working all the time and if this someone makes
> mistakes.
See comments in 1.
> 4. There should be good software available for it or at least become
> avalilable in the near future. Some kind of compatibility with a
> "standard" such as UNIX would be nice. It would make porting easy.
Again, the "professional" version has a fine C compiler that is
reasonably UNIX compatible.
> 5. It should provide (or be integrated with) a modern developing
> system. Editor, compilers, linker, debugger, make, and so on.
> All powerful, fast, and easy to use. Compilers should of course
> generate quick code.
See comments on 4. The "professional" version has all plus two editors:
Emacs and a line editor "ed".
> 6. Multitasking is a must.
OS9 is multitasking.
> 7. Real time capabilities might be useful.
OS9 is real time.
> Nice but not absolutely neccessary would be:
>

Someone will probably come up with an emulator, but there may be some
issues with the programs using resources improperly for OS9 to cope.

536. Supervisor Mode query

Newsgroup: comp.sys.atari.st
Date: 1987-12-07 22:06:00 UTC
From: dcripe@ccvaxa.UUCP
Message-ID: <26800013@ccvaxa>
Source record: 255686

I'm currently investigating the possibility of porting the Xinu (Xinu Is Not Unix) operating system (Comer, Operating System Design: The Xinu Approach, Prentice-Hall) to the Atari ST.

What I have: Atari ST 1040, and Lattice C (no assembler) compiler.

What I need: Information reguarding the "swap timer interrupt vector" call.

When the interrupt occurs, does the installed interrupt service routine get executed in Supervisor mode? From what I have read of the 68000 I believe that this is probably the case (I can find out, but I'd actually have to write a test program, and you know how lazy us CS types can get). I need to get control away from the kernel so the new operating system can take over certain tasks.

If there's an easier way to get into supervisor mode I'd like that information, too.

I would like to be able to design the system so that each process can access both Gem and Xinu facilities without interference. This is probably going to be painfully difficult, and I'm working on it in my spare time (very little of it I might add), so don't expect anything spectacular soon.

Responses might not be of interest to the general readership, so you better reply to me directly. If I don't hear from you in a few days, forget it: I'll write the darn test program and find out for myself.

Thanks in advance,
Dan Cripe

Disclamer: Since I've no opinions to express, I doubt that anyone cares if I disclaim them or not. But to satisfy those of you who hunger for such statments, "My employer does not necessarily agree with any opinions expressed or implied, nor does my employer support any statments of alleged fact."

This is another OSS Personal Pascal tutorial. You can put it up on BBS systems, on user disks, etc. I just don't want to see them come out in a book (without my name on it... :-))

Length c600 lines:
----------CUT HERE----------

Now What?
OSS Personal Pascal and the beginner - part 4
written by David Meile

[Copyright 1987 David Meile, all rights reserved. Permission is given to Atari user groups to reprint this article, as long as this statement is included. OSS Personal Pascal is a product of Optimized Systems Software, Inc. I am not related to the company, I simply bought their compiler.]

Welcome back for a fourth round of Pascal programming. Over the next three columns I will be looking at creating dialog boxes, then creating menus. Once the basic application is understood, I will explore the myriad intricacies of Event Management.

Both dialog boxes and menus follow the same patterns within Personal Pascal. First, we allocate space for the dialog box/menu. Next, we describe the kinds of things we want to go into the dialog box/menu. Then, we describe the ACTUAL things we want to put within the dialog box/menu. After all of that, we can actually call procedures to DRAW the dialog box/menu. And finally, we can erase the dialog box/menu. Of course, when we end the program, we should always release the space we allocated. (A clean workspace doesn't contain surprises!)

Aside from alert boxes, dialog boxes are the only GEM routines that don't require us to know anything about "event management". Even so, there are a LOT of different things that can be done with a dialog box. If necessary, I suppose that you could write an entire program using nothing but dialog and alert boxes. (This month's program is a fair example ...)

Take a moment now to look over the program 'NowWhat4'. Then shift to the explanation at the end.

```
PROGRAM NowWhat4;

{ The purpose of this program is to demonstrate some of the many
ways dialog boxes can be created and used in a typical program,
indeed, dialog boxes can be used EXCLUSIVELY in a program --
```

```
though it's not recommended! }

```

AND NOW ... WHAT'S GOING ON

The program listing for NOWWHAT4.PAS is about four pages long. There are three procedures and a main program. Each procedure creates a dialog box and lets you do something, like point-and-click the mouse or typing your first name.

The first thing each procedure does is set up a dialog box with a call to the function "New_Dialog". The call looks like this:

```
DirBox := New_Dialog( num_item, x,y, w,h );
```

where "num_item" is the number of items you're going to put into the dialog box. "x" and "y" indicate where the top left corner of

the dialog box should be. If both are 0, then be sure to make a call to "Center_Dialog" later. "w" is the box width, and "h" is the box height (in characters). "DirBox" is the variable we use to tell GEM which dialog box we are interested in.

The next thing each procedure does is indicate what items should go INTO the dialog box. You should NEVER have more "Add_DItem"s than the "num_item" you indicated in the call to New_Dialog. The call looks like this:

```
Box1 := Add_DItem( DirBox, G_Box, none, 2,1, 26,5,
1, (Red*4096) | (5*16) | Green );
```

The call to Add_DItem can have *lots* of basic parameters, but they all follow simple rules.

1) Indicate WHICH dialog box the item is associated with
2) Indicate the TYPE of item is being added
3) Indicate any FLAGS to be associated with this item
4) Indicate the POSITION of the item in relation to the top, left part of the dialog box
5) Indicate the DIMENSIONS of the item
6) Indicate a BORDER for the item
7) Indicate the COLOR(s) to be associated with the item.

Let's take, for example, the declaration of BOX1 in the procedure Do_Things:

```
Box1 := Add_DItem( DirBox, G_Box, None, 2,1, 26,5,
1, (Red*4096) | (1*16) | Green );
```

"DirBox" is the dialog box where we want to put "Box1".

"G_Box" is the item type. G_BOX is an outline of a box which can be filled with some color and pattern. G_IBOX is another kind of box, which cannot be filled. Other item types used in the program NowWhat4 include G_STRING, G_BUTTON, G_FTEX, G_TEXT, G_BOXTEXT. Look at the program to see how each is used.

There are no flags to be associated with "Box1". However, you can see examples of flags in the procedure "Get_Text" in the program above. The OK box has flags SELECTABLE and DEFAULT assigned to it, while the cancel box has flags SELECTABLE and TOUCH_EXIT assigned to it. You assign more than one flag using the "|" in Personal Pascal:

```
SELECTABLE | DEFAULT
SELECTABLE | TOUCH_EXIT
```

The DEFAULT flag indicates that this item is the default when you press the return key (or click on it with the mouse). The TOUCH_EXIT flag indicates that the item is selected as soon as you click the mouse while pointing at it.

All items have a POSITION. "Box1" is to be located two characters to the right and one character down from the top left of the dialog box.

Likewise, "Box1" has DIMENSIONS. Box1 will be 26 characters wide and 5 characters high.

The border value indicates how "thick" the item's border (if any) should be. Positive numbers thicken toward the center of the item, while negative numbers thicken away from the center of the item. For all practical purposes, the value should be between -4 and +4. For example, Alert Boxes have a border around the default button of 3. A value of 0 specifies "no border", which can be useful in creating "hidden" boxes.

Most item types can be assigned colors. The exceptions are buttons and strings. For example, in the procedure GET_TEXT, the items with G_STRING type have no color assigned. Likewise the OK button has no color assigned. You still have to assign colors to these items (using 0 for example), but they will be ignored.
The color(s) of an item can be indicated in two ways if you have version 2.0 of OSS Personal Pascal. If you are still using version 1.0, then color characteristics are indicated in this manner:

```
Border color (color*4096)
Text color (color*256)
Text mode (128) {for "replace" mode}
{otherwise, "transparent" mode}
Fill pattern ([0..7]*16} {where [0..7] is the "density" of
the color fill}
Fill color color
```

Colors are created the same way flags were above, by combining one or more of the 5 characteristics above. For example, "Box1" has the following:

```
(Red*4096) | (1*16) | Green
```

indicating a red BORDER, a very light density fill, and a fill color of green.
Of course, if you are programming for both color and monochrome monitors, you will want to limit you color choices! For example:

```
(Black*4096) | (Black*256) | (7*16) | Red
```

will produce a solid-red-filled item with black text. On a monochrome monitor the text will be obscured by the solid-fill; it will be a black box for all intents and purposes. Remember -- you should be programming for the greatest variety of users, regardless of monitor type.

With the release of version 2.0 of OSS Personal Pascal, the color selection above has been simplified with a function called

D_COLOR. It is called as follows:

```
Box1_Color := D_Color( Red, No_Color, False, 1, Green);
```

This is equivalent to (Red*4096) | (1*16) | Green

All of the parameters for this function call are Short_Integers, with the exception of the third, which is a boolean indicating transparent (False) or replace (True) modes for text.

NOTE: You want to use TRANSPARENT text mode if you have a fill pattern other than 0!

MOVING RIGHT ALONG

Whew! That was a lot of stuff for only one function call!

Of course, once you've added a text item, you will want to indicate what sort of text you want. This is what the procedure SET_DTEXT does.

Calls to Set_DText look like this:

```
Set_DText( DirBox, Explain1, 'This DIALOG box is', System_Font,
TE_Center );
```

DirBox is the dialog box. Explain1 is the item we want to set the text for. 'This DIALOG box...' (or anything between single quotes in this position) is the text we want to assign to Explain1. The next parameter indicates the font size and type. System_Font and Small_Font are the only recognized fonts at this time. System_Font is the regular font size. TE_xxxxx indicates the justification to be used. XXXXX can be LEFT, CENTER or RIGHT. The justification parameter may be ignored by certain item types, but you still need to include it in the call to Set_DText.

Editable text fields use the procedure SET_DEDIT. In our programming example above, this is called once in procedure GET_TEXT:

```
Set_DEdit( DirBox, Editted, 'Name: __________','aaaaaaaaaa','',
System_Font, TE_Left );
```

You will notice that it is very similar to Set_Edit, but there are three string parameters instead of one. The first ('Name...') is the "input template". The '_' characters indicate where the user can type in text.
The second ('aaa...') parameter is the "validation template". You need as many characters here as you have underscore '_' characters. In this example the 'a' character indicates you can type upper/lower case alphabetic characters only. '9' would indicated decimal numbers only, etc. Check your manual for a full list of validation characters.
The third ('') parameter is the "initial" set of characters to

be displayed where the '_' is. You can use this to put a default value on the edit line, so the user only has to press the return key if no changes are necessary.

NOTE: Use Set_DEdit only ONCE. If you want to change the text at all in future calls, use Set_DText.

With the initial setup complete, we can finally produce a dialog box on the screen. You set it up as follows:

```
Center_Dialog( DirBox ); { used if the New_Dialog call has
0,0 as the position parameters,
otherwise you don't need it }

GotLine := Do_dialog( DirBox, Editted );
```

The function DO_DIALOG has two parameters. The first is, of course, the dialog box we are dealing with currently. The second indicates the item number of an editable text field. The cursor will be put on the edit line. If you don't have an editable text field, or don't want the cursor on the edit line, you must use 0 as the value.

Do_Dialog returns the index for the item which caused a return from the dialog box. Return keys, mouse clicks on button items, etc. will cause the return

We assign the value returned by the call to function Do_dialog to the integer variable GotLine. We now test for what was done while the dialog box was on the screen.

```
IF GotLine = OK THEN
Get_DEdit( DirBox, Editted, Edit_Line )
ELSE IF GotLine = Cancel THEN
Edit_Line := '..No name..';
```

This statement tests whether the OK button was clicked on or the return key was pressed (OK, being SELECTABLE | DEFAULT, will return the "OK" value either way). If so, then we assign whatever text was typed in to the string variable Edit_Line.
If the Cancel box was clicked on, then it doesn't matter what was typed in, we ignore it and assign a default value to Edit_Line indicating no name was typed in.

If we are finished with the dialog box, we can call END_DIALOG. Otherwise, we can present the dialog box again using REDO_DIALOG. An example of this is in the procedure DO_THINGS.

If we plan to reuse the dialog box in our program, we don't have to do anything else. However, if we need to free up space for other things, we can delete the dialog box using DELETE_DIALOG. An example of this is in the procedure DO_THINGS as well.

Finally, in the procedure DO_THINGS, there are lines to change a number within a "slider box". The procedure "OBJ_DRAW" is available in version 1.0 of Personal Pascal when declared as I have done in this program. You must use the lines as I have given them to change text within a dialog box:

```
Set_DText...
work_rect...
obj_draw...
```

In version 2.0 of Personal Pascal OBJ_REDRAW is supposed to be there, it's listed in the manual, but it is not. You can use the procedure declared in NowWhat4.pas, or you can use the procedure SHOW_DIALOG (which has the same parameters as OBJ_REDRAW):

```
Set_DText...
show_dialog...
```

That's all you should need to get started building your own dialog boxes into your programs. There are several other functions and procedures which I haven't mentioned so far. Look in your manual to discover some of the more "esoteric" ways of working with dialog boxes.

SOMETHING A BIT DIFFERENT

You may have noticed the following line in the above program:

```
TellIt := concat( '[0][The direction|chosen was|',
Location, '| ][ OK ]' );
```

When you have to insert text within an Alert Box, you can do so easily using the CONCAT function. Concat takes two or more strings and makes them into one big string. If LOCATION is 'North', then TellIt becomes:

```
'[0][The direction|chosen was|North|][ OK ]'
```

You can custom-build an Alert Box using this little trick!

You may have also noticed the line:

```
N := chr( 1 ); S := chr( 2 ); E := chr( 3 ); W := chr( 4 );
```

This assigns "arrows" pointing in the directions of up, down, right and left respectively.

FINAL WORDS

I have been entirely too long getting this article out, and I apologize. I hope that you have found the previous three articles useful. I fully intend to complete this series "real soon", and then, perhaps, to go onto some more difficult programming articles.

Feedback is appreciated. If your user group uses this article in a newsletter, I'd appreciate seeing a copy. Mail will reach me at the following address:

This is another OSS Personal Pascal tutorial. You can put it up on BBS systems, on user disks, etc. I just don't want to see them come out in a book (without my name on it... :-))

Length c420 lines:
----------CUT HERE----------

Now What?
OSS Personal Pascal and the beginner - part 3
written by David Meile

[Copyright 1987 David Meile, all rights reserved. Permission is given to Atari user groups to reprint this article, as long as this statement is included. OSS Personal Pascal is a product of Optimized Systems Software, Inc. I am not related to the company, I simply bought their compiler.]

Looking at files

One of the most useful things about a computer is that it can store and retrieve information on a more-or-less permanent basis. Without this ability, you could not be reading this article in the first place ... I'm typing at my computer, I'll then STORE what I've typed onto a disk file, then I'll transfer the disk file electronically, where it will once more be stored as a disk file (on a somewhat more powerful computer, mind you, but the principle remains the same!).
So, how do I get OSS Personal Pascal to store things? And, more important, how can I retrieve what I've stored? There are a small number of Pascal routines that will read and write things onto a disk drive.

A simple text file copy program

```
PROGRAM filexfer;

{ Take lines from an input file and place them in an output file }
{ Works on TEXT files with 80 characters or less per line }

CONST
{$I gemconst.pas }

TYPE
{$I gemtype.pas }

VAR
ifile : file of TEXT;
```

```
ofile : file of TEXT;
istring : string;
ipath : Path_Name;
iname : Path_Name;
oname : Path_Name;

{$I gemsubs.pas }

BEGIN
IF Init_Gem >= 0 then
BEGIN
ipath := 'A:\*.*';
iname := '';
IF Get_In_File( ipath, iname ) THEN
BEGIN
Reset( ifile, iname );
oname := '';
IF Get_Out_File( 'Write to ...', oname ) THEN
BEGIN
Rewrite( ofile, oname );
WHILE NOT( eof( ifile )) DO
BEGIN
Readln( ifile, istring );
Writeln( ofile, istring );
END;
Close( ofile );
Close( ifile );
END;
END;
Exit_Gem;
END;
END.
```

What's going on?

The program above is an EXTREMELY simple copy program. It reads in a line of text from a file and writes the line out to another file. It also makes use of the two ready-made dialog boxes that OSS Personal Pascal has provided. There are two text files, designated by 'ifile' and 'ofile'. One is our input file, the other will be our output file. I'm assuming that the input file has lines of text 80 characters in length. 'Iname' and 'oname' are assigned the actual names of the files to be involved.
After GEM gives us some space to work, the initial path name is set to 'A:*.*' and the initial file name is cleared. This is IMPORTANT, as the 'Get_In_File' procedure uses the initial path to search for a file, and strange things happen if the initial file name is left up to the whim of the machine. In Pascal, you should set up the initial value of a variable,

as you cannot depend on the compiler to do it for you.
Get_In_File is a dialog box, thoughtfully provided for you by
the people at OSS. It should look familiar, as it is the "standard"
GEM file-choice box, and works in the typical GEM manner. If we
don't select a valid file name, the program ends.
Once we have a file name (and path), we can open the file and
point to the the beginning of the text file using 'Reset'. Now,
whenever we want to refer to our text file, we use the variable
'ifile'. You can have several files open at one time, as long as
you use different variable names for each file.
'Oname' is cleared, and a call is made to the other dialog box
that OSS provides. 'Get_Out_File' is simpler; a box with a
message that you can provide (like 'Write to ...'), and space to
type in a file name. If you choose a file that already exists,
you will get an alert box asking you to confirm your choice. Neat!
And you didn't even have to set it up...

When you want to write to a file, you use the procedure
'Rewrite'. This actually creates the file, and sets a file
pointer to the beginning of the file. If you rewrite to an already
existing file, you destroy its contents, so be careful.
If you are at the end of a file, the value of 'eof(ifile)' is
TRUE. This is the basis of the WHILE loop in the program. It
means "Peek at the file. If there is still more to read then do so,
otherwise we're done".
The 'readln' and 'writeln' work the same here as they do when
you are typing away at the keyboard. In fact, you are actually
reading from a file called INPUT when typing at the keyboard, and
writing to a file called OUTPUT when printing something on the
screen. These are "implicit" files, and save you a lot of typing
when in the editor. The full syntax is:

```
READLN( input_file, var1, var2, ..., varx);
WRITELN( output_file, var1, var2, ..., varx);
```

Of course, you should also CLOSE a file once you are done with
it, and that's what the 'Close' procedure does.

That's it! You should be able to use these examples to do
things with any text file. You can read and write to text files
in exactly the same way you read and write from the computer's
hardware. You just have to set things up in advance.

Records and other file types

There are other types of files. You can have files of integers,
files of characters, files of records... They all follow the same
basic rules, which are somewhat different from those of text files.
Here are two more short programs, one to get information INTO a file
and another to read information back OUT of a file.

```
======================

PROGRAM make_data;

{ Create a data file of 3 records }

CONST
{$I gemconst.pas}

TYPE
{$I gemtype.pas}

rating = ( chief, cook, bottle_washer );

info = record
name : string [30];
rank : rating;
end; {info definition}

VAR
myfile : file of INFO;
myrec : info;
iloop : integer;

{$I gemsubs.pas}

BEGIN
IF Init_Gem >= 0 THEN
BEGIN
Rewrite( myfile, 'A:\INFO.DAT' );
FOR iloop := 1 to 3 DO
BEGIN
Write( 'Name: ');
Readln( myrec.name );
CASE iloop OF
1 : myrec.rank := chief;
2 : myrec.rank := cook;
3 : myrec.rank := bottle_washer;
END; {case}
myfile~ := myrec;
Put( myfile );
END;
Close( myfile );
END;
Exit_Gem;
END.

=========================

PROGRAM read_data;

{ Read from the file created by the program make_data }

CONST
{$I gemconst.pas}
```

```
TYPE
{$I gemtype.pas}

rating = ( chief, cook, bottle_washer );

info = record
name : string [30];
rank : rating;
end; {info definition}

VAR
myfile : file of INFO;
myrec : info;

{$I gemsubs.pas}

BEGIN
IF Init_Gem >= 0 THEN
BEGIN
Reset( myfile, 'A:\INFO.DAT' );
WHILE NOT( EOF( myfile )) DO
BEGIN
myrec := myfile~;
WITH myrec DO
BEGIN
Writeln( name );
CASE rank OF
chief : Writeln( 'chief' );
cook : Writeln( 'cook' );
bottle_washer: Writeln( 'bottle washer' );
END; {case}
END; {with}
Get( myfile );
END; {while}
Close( myfile );
END; {if}
Exit_Gem;
END.

-----------------------------

And now ... an explanation
--------------------------

A lot of things are going on in these two short programs! If
you've never seen a record before, or an "enumerated ordinal type"
pay close attention as we go through Program Make_Data.

The first thing you see are several TYPE statements. There is
'rating', an "enumerated ordinal type". That's a fancy way of
saying that the words within the parentheses increase in value as
you go from left to right. (I.e. "chief" is actually a lower
ordinal value than "bottle_washer"!) Do not confuse this type for
strings. The string 'chief' is NOT equivalent to the ordinal
```

value chief.
Enumerated ordinal types can save a lot of space in files. They don't take as much room as an equivalent string, and Pascal works with them quite easily. They also have an advantage in that, while you can't use a string constant in a CASE statement, you can use an enumerated ordinal value.
The 'info' type is a record. Records are groups of variables that are related to each other in some way. For example, you might want to keep track of your albums using a record (pun intended). You might define it thus:

```
album = record
title : string [30];
catalog_num: string[10];
year : integer;
artist : string [40];
end; {album record definition}
```

All those variables relate to one album. A file of records would be able to track many albums in a collection. In the program make_data, we have a 'file of INFO', relating name and rank in each record.

Again, we use 'rewrite' to let Pascal know that it should associate the file name 'A:\INFO.DAT' with the file variable 'myfile'. This also opens up a disk file called 'A:\INFO.DAT'.
I ask for a name, and assign it to the record variable 'myrec'. Note, the record variable name is 'myrec'; the variable WITHIN the record is 'name'. So, I use 'myrec.name' to refer to the name portion of the record 'myrec'. Likewise for 'myrec.rank'.
OK. I've assigned values to both parts of a single record. I want to write them to my file. First, I need to 'point' to the record. So, I assign 'myfile~' (that's a carat mark at the end) the value of myrec. Myfile~ is a file pointer. Think of the statement

```
myfile~ := myrec;
```

as putting the value of the record I want to store into the file output buffer (in this case). When I 'Put(myfile)', I write the file output buffer (which contains the value for my record) to the disk. Got it?
Close(myfile) wraps things up, and I'm done.

Now I have a data file. How do I read things back out? It's fairly simmple, and we do it in the program Read_Data.
Instead of rewrite, we use 'reset' to open a file for reading. Once the file is open, we go into a WHILE loop. If there is information in the file, NOT(eof(myfile)) is TRUE and the WHILE loop is executed.
Reset actually puts the first record into the file buffer 'myfile'. It's pointer is myfile~, and we can assign myrec the

value of the file buffer using the reverse of the previous
statement

```
myrec := myfile~;
```

It gets tiresome typing 'myrec.name' and 'myrec.rank', so Pascal
provides a "shortcut", called the WITH statement. When I write

```
WITH myrec DO
```

it's like saying "pretend there's a 'myrec.' in front of variable
names." So, 'name' is really 'myrec.name', etc.
The last statement in the WHILE loop is 'Get(myfile)'. It
reads another record into the file buffer and, if it's NOT the
end-of-file (eof) marker, then the WHILE loop gets executed once
more. When I reach the end of the file, I close it and end the
program.

Some other file handling procedures

Here are some short program fragments to explain some of the
other file handling procedures...

To rename a file, use the Rename procedure:

```
...
Reset( ifile, 'A:\OLDFILE.DAT' );
Reset( nfile, 'A:\NEWFILE.DAT' );
Rename( ifile, nfile );
...
```

To erase a file:

```
...
Reset( ifile, 'A:\BYEBYE.DAT' );
Erase( ifile );
...
```

Standard Pascal files are SEQUENTIAL. You read record 1, then
record 2, then record 3, etc. OSS Personal Pascal allows you to
use RANDOM ACCESS files (but NOT for text files). You use the
Seek() procedure:

```
...
Seek( ifile, position );
Get( ifile );
irec := ifile~;
...
```

The program fragment means "Get the record indicated by the
integer value 'position' in file 'ifile', read it into the file
buffer, and assign the value there to the variable 'irec'."

To use random access files properly, you need to keep track of where things are. Think back to the golden days of BASIC for ideas on how to accomplish this. (HINT: you can SORT an ARRAY on some key RECORD VARIABLE and SAVE the SORTED ARRAY in another FILE...)

Wrapping up

There's a LOT of information in this article. It will take practice to use it well. Files and records are some of the hardest parts of Pascal to use correctly and efficiently. I hope I've set you well on your way to finding useful methods for implementing files in OSS Personal Pascal!

Next time ... Remember the alert box with Now What? Well, I've managed to turn it into a DESK ACCESSORY. How? Find out in part 4.

David Meile
Box 13038 - Dinkytown Station
Minneapolis, MN 55414

Minor notes

Were you disappointed to learn that the "special" characters are unavailable in OSS Personal Pascal? According to the manual, the CHR() function accepts values from 1..127. It will actually accept more [I assume from 1..255, but have not tested EVERY value]. For example:

```
...
mystring := Concat( 'Copyright ', chr(189), ' 1987' );
writeln( mystring );
...
```

How do you tell what resolution your computer is in? Use this function:

```
FUNCTION getrez : integer;
XBIOS( 4 );
```

Then, call it like this:

```
CASE getrez OF
0 : Lo_res_stuff;
1 : Med_res_stuff;
2 : Hi_res_stuff;
END; {case}
```

539. OSS Personal Pascal tutorial #5

Newsgroup: comp.sys.atari.st
Date: 1987-12-07 22:55:00 UTC
From: DAVIDLI@SIMVAX.BITNET
Message-ID: <8712080003.AA03228@ucbvax.Berkeley.EDU>
Source record: 255689

This is another OSS Personal Pascal tutorial. You can put it up on BBS systems, on user disks, etc. I just don't want to see them come out in a book (without my name on it... :-))

Length c420 lines:
----------CUT HERE----------

Now What?
OSS Personal Pascal and the beginner - part 5
written by David Meile

[Copyright 1987 David Meile, all rights reserved. Permission is given to Atari user groups to reprint this article, as long as this statement is included. OSS Personal Pascal is a product of Optimized Systems Software, Inc. I am not related to the company, I simply bought their compiler.]

In this fifth article on programming using OSS Personal Pascal, we will take a look at the "how-to" of creating GEM menus.

Creating menus is similar in many ways to creating dialog boxes. First, we allocate space for the menu. Then we describe the titles that will appear on our menu bar. Then we describe the items that will appear under each title of the menu bar. After that, we define the characteristics (if any) for those menu items. Then we DRAW the menu on the screen.

At this point, we depart from the way dialog boxes are handled. The reason is that GEM menus require the use of an "event manager". This manager receives messages from GEM about keypresses, mouse point-and-clicks, window manipulation, etc. and responds according to how we want our program to handle these messages. Since this column is directed towards menus, I won't go into all of the options for event management -- instead I will show you the minimum amount of event management required to handle menus.

Once we are done with a menu, we can erase it from the screen. If our program has no further need of such a menu, we can delete the menu from the computer memory, freeing up some space for other things in our program.

****WARNING****

As released by OSS, both version 1.0 and 2.0 have a "bug". You cannot run a program which calls MENU_TEXT sucessfully until you remove the three letters "VAR" from the parameter list for

the procedure Menu_Text (located in GEMSUBS.PAS). Make this a
permanent change to that particular file, and all should go well
when you compile.

AN EXAMPLE ...

Take a moment now to look over the program 'NowWhat5'. I'll be
explaining it at the end of the listing.

```
PROGRAM NowWhat5;

{ This program demonstrates the creation and manipulation of
GEM menus using OSS Personal Pascal. }

{$I gemsubs.pas}

{NOTE: version 2.0 owners, use this with the new gemsubs.pas.
version 1.0 owners, use the individual 'includes' of
gemconst.pas, gemtypes.pas and the old gemsubs.pas. }

AN EXPLANATION

A menu requires a pointer, titles for the desktop menu bar and items to go under those titles. Locate the section titled { Set up the menu. }. Note that it is somewhat similar to the way we set up dialog boxes last column.

First, we identify a specific menu by name, in this case I called it 'le_menu'. The function that does this is NEW_MENU. It's parameters are (1) the number of items to be associated with this menu (including menu titles and items) and (2) the text string which will go under the DESK menu title -- which is usually something like "About this program".

Next, we identify the other titles that will appear on the menu bar at the top of our screen, using the function ADD_MTITLE. The parameters are the menu pointer (le_menu), and the text string identifying the menu title. Here, 'le_file' refers to the menu title "Files". Similarly 'le_show' refers to the menu title "Show". The variables will be used when adding specific items under the menu titles.

After adding all of the titles, we add items to go under the menu titles, using the function ADD_MITEM. It's parameters are (1) the menu pointer, (2) the menu title and (3) the specific text string that will refer to the item. We will use the item variables when we wish to change the appearance of a particular text string.

MENU_CHECK adds a check-mark to the left of a menu item. For that reason, you should put at least two spaces to the left of a text string referring to a menu item, so there is enough room for a check mark. All of the menu items are defined in the program with two spaces to the left of the text string. MENU_CHECK has a boolean variable as the last parameter -- you can tell it to check or "un"check a menu item depending on whether the variable is True or False. The menu item to be checked is referred to by both the menu pointer and the menu item.

MENU_DISABLE has a complementary procedure called MENU_ENABLE. Both procedures are called in the program NowWhat5. MENU_DISABLE produces "ghost" writing -- the item is grey instead of black, showing that the item is unavailable. Also, when an item is disabled you can click on it all you want, but the event handler will not recognize it.

WITHIN THE REPEAT LOOP

All of this takes us to the beginning of the actual work within the program NowWhat5: the REPEAT loop. First we set the variable that will cause the program to repeat the loop until it is changed. The variable is 'bye', and it will only be set to a True value if we select the Quit option from the menu we've created.

The three IF statements test to see whether we have chosen anything under the Select menu. Depending on whether none, some, or all items under the Select menu have check marks by them, we display an appropriate message at the top of the Show menu.

Right after the IF statements is the heart of the repeat loop - the call to the event manager, GET_EVENT. There are many variables and options for this function, and I won't go into them all here, as I'll be doing so in a later column. The important things to know are:

1) E_Message is a message event. Here, it is used to indicate that the user has clicked on one of the menu items.

2) msg is the message buffer. There are many sorts of messages which may be returned, but we are only interested in two elements of that message buffer:

msg[3] refers to the menu title which has been selected
msg[4] refers to the menu item selected

If there were more than one event possible in this program, we would first have to test whether msg[0] referred to a MN_SELECTED state before assuming msg[3] and msg[4] referred to a GEM menu. Please make note of this if you also are handling other window events at the same time (more about this will appear in the next column).

A menu-event where msg[3] = 3 always refers to the 'About' item under the Desk menu title. In the program, we draw an alert box with information about the program when we select the 'About...' item.

What follow are a large number of IF statements. There is an outer IF statement (IF msg[3] = xxx) and one or more inner IF statements (IF msg[4] = xxx). They test to see which menu title is referred to (msg[3]) and then which message item is reffered to (msg[4]). Then, depending on what the menu item actually is, several other statements may be executed.

For example, if msg[3] = le_file and msg[4] = quit then we set the variable 'bye' to True, which enables us to exit the repeat loop.

For the Select title, we toggle between the checked and unchecked state using the statement

```
opn := NOT(opn)
```

then, depending on the state of 'opn' we enable or disable the corresponding menu item under the Show title.

For the Show title, we can select the upper default, which will print out a joke if it is enabled, or we can select an individual joke if it is enabled. Of course, when all jokes are disabled nothing will be shown.

The logic of the IF statements may seem to be complex, but if you actually run the program, you will be able to see what happens when you select the various menu items. If you have desk accessories, I would suggest you do not select them from the Desk menu title as they will have unpredictable results within this particular program (due to the very minor "event management" going on.)

Finally, before we repeat the loop we make a call to Menu_Normal using the menu title (referred to by msg[3]). The reason this is necessary is that GEM will highlight that menu title when you select a menu item, and will NOT return it to normal automatically.

When we are done with the menu, we can erase it from the screen using ERASE_MENU and then remove it from computer memory using DELETE_MENU. Of course, if you're going to use a particular menu more than once in a program, it makes sense not to delete it. You can issue a call to DRAW_MENU after you've called ERASE_MENU, and all of the menu items will be in the same state as before.

ANOTHER THING

You will notice that I have not created a normal window in this program. Instead, I made a call to CLEAR_SCREEN instead. As a precaution, I first hid the mouse, then cleared the screen, then showed the mouse again. When you only want a blank page upon which to draw graphics or menus or dialog boxes, you can use this call. Clear_Screen will cover ALL WINDOWS, regardless, so don't use it in a case where you have multiple windows (or where you are going to create windows). The full-screen window will not go away until you end your program. Be aware.

FINAL WORDS

I have been entirely too long getting this article out, and I apologize. I hope that you have found the previous articles useful. I fully intend to complete this series "real soon", and then, perhaps, to go onto some more difficult programming articles.

Feedback is appreciated. If your user group uses this article in a newsletter, I'd appreciate seeing a copy. Mail will reach me at the following address:

Well I tried to send mail to this person and failed... But just to make sure
no misunderstandings come up (like the time a month ago when everyone wanted
the ST Amiga emulator mailed to them) --- The Amiga STEmulator is a joke,
much like the ST Amiga emulator. It appeared many moons ago, on Fish 43.

After I posted my message about the GEMBOOT prg. not working properly, I
received a message stating that GEMBOOT will not work properly with the new ROMS,well he
also stated that there is a prg. call something like "FOLDRXXX.TOS",
will this prg. work with the new ROMS? If it will do the trick could someone
that has it please sent it to me in a reply msg. PLEASE do not send it via
the binaries section I will never get it.
Thanx in advance

On another tack...First, I doubt the cost of adding midi to the ST is more than $2.00 or so in parts to Atari. Second, there are more uses of midi ports than using them as connections to musical instruments. I do happen to have a Casio keyboard attached to mine (nice since more and more games coming out automatically play music TO the midi port just in case a keyboard is attached...as well as through the normal speakers.) And about 20% of the people I know have keyboards (I am not musical at all, so that isn't the reason). In any case, I would say that there are two other very good uses for midi on the ST right now. One is as a cheap LAN (which is available from several companies already on the ST, not sure about on the Amiga), and also for things like MIDIMAZE (which, if it ever comes out on the Amiga will probably sell more midi adapters than midi keyboards will). The Midimaze craze, if you haven't heard, is where you get up to 15 other people to haul their ST's over to your house, string midi cables from room to room connecting all the machines, and then waste an entire afternoon (and evening) wearing out your palms and firing button fingers (and lungs) wandering through mazes shooting at other players. I think 8 of us were enough to alienate my wife the last time we played (YES, I ADMIT IT, I PLAY GAMES ON MY ATARI! Why not?)

Also, all this arguments over which computer is better is kind of silly. I had an Amiga for a while (and still have a Mac and an IBM PClone), and it was/is a nice machine. The Amiga was about 6 months behind the ST on certain features that I found useful (Compilers, utilities, etc) and was ahead of the ST in other areas (HAM pictures, psuedo multitasking, sound applications). For some reason, I just found programming on the ST more straightforward (I had problems on the Mac as well.) It was probably just my background and my desire to be able to move things back and forth between Unix that made it hard. Time will tell.

Before we get into this again, the ST emulator for the Amiga is the same
as the Amiga emulator for the ST - namely, a joke. It puts up a "GEM"
desktop, and whenever you click on anything, it puts up the 'bomb' symbols.
It certainly does NOT emulate anything useful!

FOLDRXXX starts up with a little table of ROM versions and corresponding to each version an address. At that address it inserts a list of memory pieces to be used. If you use new ROM's these addresses have been changed so you cannot use FOLDRXXX unless you figure out the new address you need and substitute the necessary information into the binary of FOLDRXXX (or a disassembly). On the other hand: the new version of the ROMs for the Mega has a much larger OSpool from which these memory blocks are taken. It used to be 6000 bytes, but the new size is 16000 bytes. I don't know whether this makes FOLDRXXX superfluous. Maybe Allan Pratt can comment on that.

Sheesh! The first 2 or 3 replies to my post would have sufficed, but I can see that their is a good chance that I'll probably get a reply from every Amiga owner on the face of this planet with netnews access. I didn't mean for this post to be a vicious flame, but all the Amiga owners obviously took it that way. Don't take it to be a direct attack on your machine.

This is what I was trying to say:

If a musician decides he should have a computer, not only to help him with producing music, but also to handle some other simple things like keeping his checkbook in balance, to replace his typewriter, and of course to play decent games on; he should look at how simple the machine is to acquire, assemble, use and maintain. Having to worry about the midi level converter as an extra item is not a problem with the ST. They both have very user friendly interfaces, although it's debatable which one is more user friendly. Finally, as far as the average musician is concerned, each machine is equally powerful (Read: they both can play great music and great games!). One final comment: I've noticed, from talking to various musicians around here, that they usually are not very concerned about the built-in sound capabilities of computers, but rather if the computer can make their own perticular keyboards sing.

Rex.

>a small buisness computer (probably word processing) and turn
>it into a game computer.

First of all, I don't think they really had any intentions of making the 800 a business computer. Second, what's wrong with the 800 being a game machine. It happens to be a very good one. Games are a very important prerequisite for a home computer as far as I'm concerned (probably THE most important 8-).

Some people think they need to buy a "sufficiently powerful business computer" for themselves so they can run "business applications". The truth, in my opinion, is that a home computer is something to play games and tinker with in your spare time, much like you would buy a handglider to go handgliding with or a telescope to gaze at the stars. The person that wants to take up flying as a hobby doesn't go out and buy a 747, not only is it not as fun to fly, it costs a whole lot more also. A person that wants to gaze at the stars in his spare time doesn't buy an obseratory, does he?

> [talk about atari's vapor-ware syndrome]

This can be annoying, can't it? Contrary to popular belief, Atari is not the only company with this problem.

The lastest version of GEMBOOT which was distributed something like
half a year ago, allows you to set the location of the sole undocumented
variable that Konrad uses in GEMBOOT. Matter of fact I used GEMBOOT
without problems on one of the first Mega's that arrived in Switzerland
after changing the GEMBOOT startup file.

>patches the appropriate location in the OS. In the case of the Mega
>ROMs, he actually added a pointer in the OS header which points to

^^^^^^^^^^^^^^
Didn't Atari claim it was working on a new '40 folder bug'less OS?

>Even old TOS ROM users should probably not use GEMBOOT... I certainly
>wouldn't trust it, and with FOLDRXXX and HINSTALL available, you just
>don't need it.
Hmmmm, as Landon Dyer once said (a long time ago) FOLDRXXX does NOT fix
the other problem with GEMDOS management of the internal directory
list (mutiple bad copies of the same block), GEMBOOT does provide
a workaround for this problem (so I wouldn't trust FOLDRXXX) plus
a lot of other nice things.

553. Fortran subroutines on ST

Newsgroup: comp.sys.atari.st
Date: 1987-12-08 16:32:00 UTC
From: menton%v5130b.DECnet@NRL-ACOUSTICS.ARPA
Message-ID: <8712081652.AA21081@ucbvax.Berkeley.EDU>
Source record: 255703

To those "real" programmers who use Fortran (in particular, Absoft's AC/Fortran on the ST), please be advised that several of the subroutines and functions in the fine book, "Numerical Recipes", will not run properly on the ST unless the Fortran statement "SAVE" is added to the routine. The "SAVE" statement should go just before any "DATA x.../a..." statements near the beginning of the routine.

Apparently, the VAX Fortran compiler does the equivalent of having "SAVE" in the routine as a default. Without "SAVE", the subroutine bombs on the ST but runs fine on the VAX. With "SAVE", VAX and ST both work fine and give the same answers.

Of course, if I had read "Numerical Recipes", p.14, where info on "SAVE" is discussed, I wouldn't have spent 3 days using the interactive debugger to figure out why the routine wasn't working! Naaaahhhh - reading the directions first is still an unacceptable alternative!

...

Excuse me, but college students and faculty are not the only users out there.
Personally I'm offended by the fact that you imply that there is no more
important opinion than that of someone at a university. I think you would
be surprised at how many professionals read "the net" on a regular basis.
Believe it or not, we, too, have some degree of intelligence (No, it didn't
go away when we gradutated).

Personally, I think it wise of Atari to adhere to their own marketing
strategy. I may be wrong, but I don't believe that the average net reader
has enough information to tell Atari how to conduct business. Let Atari
decide on its own whether or not to run commercials.

On the other hand, I hope that Atari does listen to us when we have
technical complaints because we are users and it is our word of mouth
that sells their computers.

555. PC DITTO REVISION 3.0

Newsgroup: comp.sys.atari.st
Date: 1987-12-08 19:04:05 UTC
From: c9c-eh@dorothy.Berkeley.EDU
Message-ID: <5262@zen.berkeley.edu>
Source record: 255705

[Wokka wokka wokka wokka...] [GULP!]

Once again, the Safety Seal strikes. Yes, this means that pc-Ditto
v 3.0 has arrived! The immediate consequence is a mini-review:

PCD (as I will call it) v3 comes with two sheets of paper about the
bug fixes and enhancements in it, so I'll make it easy on myself and just
list these (with comments):

1) PCD v2 used to have (very rarely) problems booting an MS-DOS disk.
Sometimes it couldn't format a disk correctly, and copying with
. sometimes corrupted the files or the disk. [I've never yet run
into these problems on either version.]

2) PCD v2 failed on trying to access any hard disk partition above
D:. This has now been fixed. [Without my hard disk, I cannot
verify this.]

3) PCD v3 now runs correctly with the Mega's.

4) Under PCD v2, self-booting disks would not autoboot. Fixed.

5) RS-232 use sometimes locked up ST on old version. Fixed.

6) PCD v3 NOW WORKS WITH MONOCHROME! You can "simulate" either IBM
mono or color on the Atari mono screen. It looks to me like the
text font used for color is used here, but stretched out vertically,
so that there are blank lines interleaved in the text.

7) When you run PCD now, it will capture the time and date from TOS,
so you don't HAVE to set it.

8) And now, the mouse is supported. Either of two mouse modes can be
chosen: Microsoft or Generic. (Or it can be turned off.) The
Generic mouse merely generates cursor keystrokes when you move the
mouse, and each button can be assigned to a character, so a button-
click generates that. The Microsoft mode requires a mouse driver
(provided), and will allow the use of things like GEM and Windows
now (though I have real doubts about running things like that at
the speed PCD provides).

Overall, I like it. The revision was free, and mailed promptly.
There were README files on the disk which also cleared up problems such as
how to format 80-track single-sided disks. And the pc_ddrv file allows
reading GEMDOS format disks (82-track, 10 sectors, too).
The one big problem with pc-Ditto right now is speed. I bought it
for a specific purpose (I needed to run some IBM programs to do homework
in a class), but aside from that, I'm not positive what benefits it

provides over the ST, especially now that the range of software has
expanded so much for the ST.

It's up to you, though. If you need it, it works well.

>keys were held down, well since I started using the Mega, the machine always
>boots from the hard disk with the keys down or up?????????????

I didn't know of the CTRL-SHIFT-ALT trick, but I had a problem similar
to yours: there was no way my Mega would boot from floppy, and that
turned out to be quite a problem when a desk accessory I had downloded
from somewhere was turned unusable because of line noise. My "solution"
was not to boot from hard disk at all, which I now find better since it
allows me to choose different configurations (desk accesories and such)
depending on the job I'm going to do.

>I am also using GEMBOOT to overcome the 40 folder limit in TOS(has it been
>fixed with the new ROMS?).

I'm also interested on this question, and it has been already asked a couple
of times with no visible answer. I've never used the old ROMs, so I don't
know what the infamous "40 folder limit" means. I've had more than 40 folders
on my hard disk and nothing happened. Does this mean that the problem is
fixed? Or is it 40 folders DEEP?

If it uses the same display routine that the Colorburst demo posted to the net, save your money. That was a flickery demo that gave me a headache after a few minutes, and certainly did NOT give the illusion of having more than the usual number of colors on the screen. Yuck.

Please read K&R page 197 which requires that when the same member
names are used in different structs the types must agree from the
beginning of the struct through the member in question.

From: gpm@dukempd.UUCP
Message-ID: <427@dukempd.UUCP>
Source record: 255710

I have Mike's Ramdisk v. .95, and like the idea of what it's trying to do. It has a dialogue box as if it were resizable, but it's very buggy. Could someone send me a later version that works like it's dialogue implies it should. What I would like best of all is an eternal ram disk that I can size up and down as I see fit, but which sizes down without letting me destroy any data I may have on the disk. If anybody has and would send me or knows where I could get such a beast, I would be grateful. Thanks.

563. Don't use autorepeat in STEVIE

Newsgroup: comp.sys.atari.st
Date: 1987-12-09 05:58:37 UTC
From: georgew@tekig4.TEK.COM
Message-ID: <2233@tekig4.TEK.COM>
Source record: 255713

I just tried out the posting of STEVIE, and naturally, the first thing I wanted to try is to see how slow insert mode is, since the author mentions the slowness in the document. So I held down on a key as if I was entering a line of *'s for a block comment. Stevie got about halfway across the line and bombed. I had to reboot. I tried this three times. Twice it killed the O/S, and once it subtly corrupted the system so that when I tried to copy a file after exiting, the system told me there was "not enough memory to run your application".

Anyway, enough said. Don't use autorepeat in STEVIE. The other things I tried seemed to work OK.

By the way, there are two other pseudo-vi's around, VIX and LEVEE. Each has its own limitations. Between the three programs, you can do anything you can in vi :-)

564. PPascal Problem?

Newsgroup: comp.sys.atari.st
Date: 1987-12-09 06:24:47 UTC
From: avp@garfield.UUCP
Message-ID: <4281@garfield.UUCP>
Source record: 255714

I'm using the original version of PPascal, and have a problem (bug?)
In the program I'm writing, I call an Alert Box, and right after the
user responds, the box is erased, but a LF or two are done at the
bottom of the screen, moving thwe whole thing up. This seems to
happen less, but still happens if I run the program from the desktop
instead of PPascal. Any Ideas?

>Has anyone attempted to replace the slug-bait 68000 in their ST with a
>68010 or 68020?

Drop a 68010 in and the Operating System (TOS) dies a horrid death.
No electrical problems, just the software crashes out. The same
problem would exist for the 68020, problems multiplied many times.

You can boot an alternate OS, but then you don't get to run any
of your ST software.

I use an '010 in "that other machine". It speeds up the multiply/divide
instructions *a lot*. Other than that the increase in speed is minimal.
Since I had to replace a physically damaged 68000 in the machine anyway,
the '010 made sense.

569. DCOPY20.ARC is a hoax

Newsgroup: comp.sys.atari.st
Date: 1987-12-09 14:24:29 UTC
From: silvert@dalcs.UUCP
Message-ID: <2736@dalcs.UUCP>
Source record: 255719

I keep running into DCOPY20.ARC on file servers and BBS's. It is a hoax. Someone has taken DCOPY19.ARC and changed two bytes ONLY so that the screen header says 2.0 instead of 1.9. (You can check this with cmp -l). The documentation files are absolutely identical in every way.

This not only wastes time by people trying to upgrade, but it doesn't work right -- DCOPY supports three modes of operation by checking for the file name DCOPY19.??? and acting differently for .PRG, .TOS, and .TTP extensions. If you call it DCOPY20.??? it gets confused and may not work as it is supposed to.

I have checked DCOPY20 from three sources, and all are fraudulent. So delete it from your archives and be suspicious if it shows up again.

From: silvert@dalcs.UUCP
Message-ID: <2737@dalcs.UUCP>
Source record: 255720

Can some Magic Sac guru post an updated list of what does and doesn't run? I've been trying to get a decent terminal emulator for ver. 4.52 (with Finder 5.5, System 4.1) and find that MacKermit and FreeTerm 1.8 run, but FreeTerm 2.0 and Red Ryder 9.4 don't. I'm waiting for the new release of MockTerminal to come in, but a current listing of what will work would be greatly desired.

Are there sources of Magic disks other than Current Notes?

More postings on MS would be welcome, as I suspect that the number of users is growing, and those of you who have experience with it could be a lot of help to the rest of us.

573. OOL language on ST - use Clascal

Newsgroup: comp.sys.atari.st
Date: 1987-12-09 15:45:26 UTC
From: klt@arinc0.ARPA
Message-ID: <771@arinc0.ARPA>
Source record: 255723
Cross-posted to: comp.sys.atari.st,comp.sys.m68k,comp.sys.mac,comp.lang.pascal,comp.lang.c++

(Note that this is cross-posted to the groups to whom this problem might have relevance.)

I did some checking. So far as I know there are no PD cfront for C++ and no other C++ compliers for the Atari_ST. Objective C has also _not_ been ported to Atari_ST, more the pity. So to find a good environment to develope software with for the ST is tough.
I could use C or M2 but much of the development of good interface software would be made easier by a good OOL.

I got hooked on using an OOL when I developed a project for the Lisa 2/10 using the Workshop and the Clascal Toolbox. If only I could port Clascal to the ST......

To do that, (is that legal, hmm, what is the current and future status of Clascal in light of Object Pascal?) I would need to do several things. First I'd need a USCD P-system on the ST. [Fine, the USCD Pecan system is avaliable.] Would a 68000 based USCD P-system be compatable with a different 68000 based P-system? Can I take a Complier from the P-system (Workshop) and use on another P-system? Will it (the complier) find and use the Librarian to locate it's unit's to complete the compilation? Are there other incompatiablities I've forgotten about?

Next is the problem with Drive Formats. Does anyone know the format of Lisa Workshop disk formats. The disk could be read by the same drives that read Macintosh disk. I had the wonderful thought that perhaps the Magic Sac Translator would be able to read the Lisa Disks so I asked David Small about the situation. He though about and said that HE didn't know. (Well if he doesn't know about this situation then there not be anybody else who does know about comparative disk formats.)

Summary: Is there a another good OOL for the ST? (stripped Smalltalk doesn't count) I'd love to use Obj-C or oh-yea C++.

Is using Clascal on the ST legal?

What must be true for 68000 based USCD P-system object modules to be run compatiable?

How Can I get the Run-Time executable from Lisa Workshop disks to ST readable disk. I'm assuming that I have to rebuild the Object module for ST use.

[[Let's see if I could Clascal to Work under Beckmeyer's C-shell
I could get multi-tasking user-friendly shell for the ST. I could
get to develope Mac Software on another host. No I'm not talking
about Lisa's. hmmm- the more things change..

And then when I can afford a big hard disk.....
]]

From: jdn@homxc.UUCP
Message-ID: <2420@homxc.UUCP>
Source record: 255724
Cross-posted to: comp.sys.atari.st,comp.sys.amiga,comp.sys.mac

Some time ago, Atari announced a laser printer, but I haven't
seen any talk about the printer or software for Desktop Publishing
in the ST newsgroup recently.

1. Does a laser printer exist? Can I easily buy one?
2. Does Desktop Publishing software for the ST exist?

How do these products (if they exist) compare with Desktop Publishing
on the Amiga and Mac? Any input on the various laser printers available,
your personal experiences with the printers and software, caveats,
recommendations, etc. is very mcuh appreciated.

Thanks,

Jonathan Nagy

>pretty trivial. If not, what am I missing? Also, if my supposition
>about the linker's true, what's RELMOD for?

The linker also can search through libraries for unresolved routines, and
only pull out the modules you need. For almost two years now, the Atari
developer's kit's linker has been LINK68, which doesn't require RELMOD.

RELMOD just translated the fixup information to a more compact format. The
format used with CP/M-68K added a LONG WORD (4 bytes) to a file for each
code or data reference. The smaller format just saves the type of reference
it is. I think. It's been a while. But you get the idea.

>-+ _______________________________|

As far as I know, only one Colorburst demo was posted on the net. I downloaded that one, and I was actually impressed. It DID give the illusion of having more colors on the screen (16 shades/intensities/whatevers of blue, 16 of red, and 16 of purple). I don't know why green wasn't chosen instead, as that would have been a better "proof" that the program could show all those 3000+ colors. There was slight flickering, but only in one column of colors. On the whole, it worked really well. And the plus side, if Colorburst works by switching the display screen, is that it doesn't hog CPU time the way that Spectrum does. But then, what do I know?

well....considering the name of this notesfile is INFO ATARI...the
Amiga has been getting a lot of attention...I wouldn't mind this except
it drives me crazy to have people tell me how my Atari 1040st is "limited"
these people have been saying here and there that the Amiga has more
expansion possiblities....whether this is true or not I do not know....
I know I am a musican...and the ST is fine for me...and that, while the
Amiga is a good expandable machine, I feel the software and the company
were soooo badly organized that their machine sucks....Kickstart drove
me crazy.....so you might ask why I wrote this letter...well I guess I
am just insecure and only want to hear how good my machine is...and
frankly...I think there are very few limitations put on the ST series
considering the price....and, frankly, I don't want to hear about the
Amiba. Regarding MIDI appilications....I run Dr. T's stuff and it is
very good...better than any music program I have seen for the Amiga...
although that looks to be changing.....Master Tracks Pro is an excellent
program....but it does not, as far as I know, have scoring capablities
like Dr. T's software.....
I want to apologize to those Amiga owners out there who read this and
are terriblely insulted.....I just don't like the thought that I invested
in the wrong machine "for the future"....I get uptight about that stuff...
so flame me if you want....

damian roskill

If you're a registered owner, you MUST have Version 2. That is the only version ever offered for sale!!!! Version 1.0 was never released to anyone, according to the author. Check your bootup screen!

As for the net - I don't think I've ever seen Bill here. He frequents GEnie and CompuServe.

Sound through the MIDI for games would not be done if the ATARI had any
sound channels worth talking about. Gee, all of a sudden that $2 MIDI interface
costs as much as a Casio! Were talking dirt cheap here.

> And about 20% of the people I know have keyboards

And 50% of the people I hang around with smoke dope with the pope.

> The Midimaze craze, if you haven't heard,
> is where you get up to 15 other people to haul their ST's over to your
> house,

Well thats really stupid. The UNIX original is called HUNT. The limit
is 3 persons per machine connected via Ethernet. The game becomes more of
what unloaded machine your on. Dragging 15 computers into one locality sounds
really stupid. Whats the % of people are doing that, .00000000001?

> Also, all this arguments over which computer is better is kind of
> silly.

You got one point straight. With the Amiga and the Atari costing
the same amount for the least common denominator, the Atari is just silly,
and a waste of money. But we all know that.

> I had an Amiga for a while (and still have a Mac and an IBM
> PClone), and it was/is a nice machine. The Amiga was about 6 months behind
> the ST on certain features that I found useful (Compilers, utilities,
> etc) and was ahead of the ST in other areas (HAM pictures, psuedo
> multitasking, sound applications).

Great. Jack of all trades, a master of none. I can write utilities
in my sleep. The Amiga wasn't behind anything, just Atari's attempt to kill
what Atari knew was comming to market. Atari had the Amiga almost, but it
slipped through their fingers, being bought by Commodore.

What I can't write is hardware. I guess Atari can't either. Got a
blitter? Looks like Atari is learning what a silicon foundry is all about. Not
to mention yield factors.

Psuedo multitasking is a specialty of Apple, in the form of the
Multifinder, I suggest you move on to comp.sys.mac to talk about this
nonsense. Psuedo not spoken here. Speaking of multitasking, name ONE
Atari anything that runs on ANY Atari multitasking environments currently in
progress. Just one.

> For some reason, I just found programming on the ST more straightforward

I would too if the machine and OS did nothing. I always wanted ZERO
colors in high resolution mode. Oh wait, thats black and white, right?

> It was probably just my background and my desire to be able
> to move things back and forth between Unix that made it hard.

So why on earth do you have an Atari?

well... hmmm. using words like "sucks" is usually a good reason to get flamed.

If I were you, I wouldn't worry. If you bought your machine for music applications, it'll serve you well in the years to come. But you must realize that a lot of the things you're hearing are true --- the Amiga's price has fallen a great deal, and it is easily expandable (especially when it comes to replacing the 68000 with 68020 and possible a 68881, for instance). You gripe about the "KickStart," well, that's history now --- The 500s and the 2000s boot from ROM, and Commodore will provide ROM upgrades when the time comes to move up to a new version of the OS. You complain about software, well, some real nice stuff is appearing for the Amiga, and has been, since First Qtr 87 or so. Most of the new stuff totally blows away some of the stuff that was around in 86, for instance. Unfortunately, some people did their "Amiga-evaluations" during that time and think the machine hasn't advanced since. Rumor has it that even Dr T's stuff is being ported to the Amiga... 8-)

Anyway, another reason for the problem might be Atari itself. Especially if what I hear is true: (1) they discourage mail order sales (2) THEN they sell the 520ST without a monitor for $699 at Federated (of course, that's the only computer Federated sells, so there's no competetion for the Federated customer.) $699! The Amiga 500 dealer price is under $600!

If you want to flame Atari, do so, but without flaming or badmouthing the Amiga. A lot of Amiga owners flame or badmouth the Amiga on comp.sys.amiga (they have a right to do so 8-) but they don't flame the ST in the process.

There is indeed Desktop Publishing software out for the ST, it compares very well against the MAC, and the sort. The "Publishing Partner" and "Fleet Street" programs are full blown publishing programs, I gave a demo of the "Publishing Partner" to local printing shops last summer and they were impressed.
If I can be of anymore help let me know

From: rowley@ORVILLE.NAS.NASA.GOV
Message-ID: <8712101753.AA15437@orville.nas.nasa.gov>
Source record: 255738

I have tried some more software with the Magic Sac.

Here is an updated list of software that seems to work with the Sac:
Finder 6.0
System 4.2
MacWrite 4.6
MacDraft 1.2a (although I have heard of problems with MacDraft)
MacDraw 1.9.5
Microsoft Excel 1.03 and 1.04
Microsoft Word 3.01
Versaterm 2.3
Binhex 5.0
MacPaint
LightSpeed C 1.02
Software that does not work:
Red Ryder 9.2
New Scrapbook DA (crashes at random times)
MacWrite 4.5 (use MacWrite 4.6 instead)
CricketDraw (requires 128K ROMs)
Hypercard 1.01 (needs 128K ROMs)
Multifinder

Does anyone have the Transverter, and would they care to comment on it?

590. Atari ST Policy?

Newsgroup: comp.sys.atari.st
Date: 1987-12-10 19:12:00 UTC
From: MOLCS@UNO.BITNET
Message-ID: <8712110852.AA06284@ucbvax.Berkeley.EDU>
Source record: 255739

An open letter to Neil Harris,

Dear Neil Harris,

I have a few questions and comments:
I have a 1040 ST which has an external SF314 drive, an SC1224
color monitor. I also have a DEC DF03 1200 baud modem and a DEC LA50
Personal Printer connected to it. I purchased my ST after reading the
March 1986 Byte articles. I was, soon after my purchase, disappointed
to learn that my 1040 did not have the advertised RF port.
NOTE: My "Owners Manual" instructed me that one should be there...

I also have a CP/M-80 system.... My CP/M system included with the basic
system: The BIOS source, An Owners Manual, The DRI CP/M "docs" and other
documentation. The bundled software included: an assembler and loader;
the "standard" CP/M utilities (EDT, PIP, STAT, etc); Microsoft Basic;
and a spreadsheet MultiPlan. What did I get with my ST? 1STword, Neo,
ST-Basic, and ST-Logo, and useless docs...

Now for my questions:
Will Atari be offering any TRADE-UP programs?
If not, what about selling the Mega system unit and keyboard
sans Monitor? (I assume that my present Atari hardware will work with
the new Megas?)
Will the new Mega ST computers have more software bundled (what?)?
Also, What about documentation? My local bookstores do not even carry
Atari books (plenty of MAC, Amiga, IBM and even C-64/128 books).
Being a "poor" Computer Science student, WHAT does Atari offer me to
remain a faithfull buyer?

Michael O. Lott
MOLCS@UNO

Well, John, Yes, and No. Yes, the business world accounts for the bulk of sales. I guess they are either too busy or too stupid to wait til the prices drop (-:).

On the other hand, by whose definition do you conclude that "not too many average people have a need for a computer.."? It all depends on what you mean by "need". If my wife sees a nifty belt or outfit, she thinks she needs it (no sexism here; I do the same thing with respect to lp's, books, computer stuff). We all use various criteria in defining what we "need." If we are unaware of what a thing, device, etc., *can* do, we are less likely to see a need to have said thing or device.

My point is that when a device is new, only a small portion of the uses that device can be put to are realized by most people. Eventually, I feel that computers will be in most homes, much as television sets and telephones are in most homes. The computer (often interacting with other devices, to be sure) really offers a much wider variety of possibilities than even telephones and T.V.s.

In that regard, Atari's marketing policy (which I criticized in an earlier posting) is intriguing. I went shopping the other day and saw the Atari XE (or is it 'XT') game system. Guess what? The darned thing is really an 8-bit microcomputer complete with keyboard. Sure, the game aspects are emphasized, but the fact that peripherals can be connected, such as disk drives, is illustrated on the side of the box. I would like to have seen a statement, even in small print, such as "And your Mom and Dad can do word processing or other productivity tasks, as well!" I understand that this system runs all Atari 8-bit software.

Anyway, I foresee (crystal ball geared up) a time when most homes will have a computer system featuring electronic mail, access to many databases, educational services, etc., etc. And the way these micros will get their foot in the door (oh, God, isn't that an awful metaphor!) may be via games. It will probably be via a specific application, and thereafter people will keep discovering other things the system can do. They will

move from, for example, game players to general computer users by stages
and without having to overcome the 'computer phobia' hurdle associated
with BUYING A COMPUTER.

So much for today's crystal-balling.

Bill

>mazes shooting at other players. [...]

Our local software store has five Ataris set up to play MidiMaze.
Since I've wanted MazeWar on the Amiga ever since I first saw it, I
investigated the MidiMaze setup.

The cabling between the systems seems to indicate a ring network.
Packets are passed on to the next machine. It occurrs to me that all you
need for a ring network is an input port and an output port, and software to
interpret the data coming in.

Sounds like all you need for this is a vanilla serial port. Am I
wrong about this?

P.S: MazeWar is Yet Another game I'd like to work on......

I bought my 1040ST mono/color system as much as
anything to use as a graphics engine.
I now have Degas Elite, easydraw, CAD 3d, n-vision,
AIM, Neochrome, etc, etc.

HOWEVER, I still find that damn mouse to be impossible
to draw with!

One solution I am looking forward to (after X-mas, at
this point!) is an Imagscan digitizer, but that's not
really the point.

Has anyone found either a software package that makes
drawing with a mouse bearable (if you'll excuse the pun),
or an implement like a drawing pad (koala pad???) or
a better mouse to be more satisfying?

Recommendations, please!

595. Amiga vs. ST (was Re: MIDIMAZE/other uses..was RE: Amiga and MIDI)

Newsgroup: comp.sys.atari.st
Date: 1987-12-11 05:34:07 UTC
From: langz@athena.mit.edu
Message-ID: <2006@bloom-beacon.MIT.EDU>
Source record: 255745
Cross-posted to: comp.sys.amiga,comp.sys.atari.st,alt.flame

In article <6946@ccicpg.UUCP> harald@ccicpg.UUCP (Harald Milne) writes a high-heat, low-light response to trb@stag.UUCP (Todd Burkey)'s article <275@stag.UUCP> regarding a novel (for micros, Harald) use of MIDI. Todd also wrote

>> all this arguments over which computer is better is kind of silly.

This is something which, at least in the comp.sys.amiga community, I think we can all support. We've seen this discussion so many times, with the same path of conversation each time, that most of us have realized that the whole topic, as presented, is rather petty.

Harald had some things to say that were somewhat informative, for example:
>Psuedo multitasking is a specialty of Apple, in the form of the
>Multifinder, I suggest you move on to comp.sys.mac to talk about this
>nonsense. Psuedo not spoken here.

But then offset the value of his comment with this gratuitous spur:

>Speaking of multitasking, name ONE Atari anything that runs on ANY
>Atari multitasking environments currently in progress. Just one.

Todd had some fairly interesting things to say in his original article regarding his opinions regarding the Amiga and the ST, and qualified them by not only pointing out that they were based on his experiences in the past, and not on current fact. Harald referred to a number of Todd's comments as "stupid" and in several places strongly implied that Todd was lying about a number of issues, including of all things how many keyboard musicians Todd knows.

Harald closed his "critique" with some more Atari-bashing, and then made some more comments about Todd.

The point? The point is, even though Todd had some things to say about the Amiga, and even given that some of them were inaccurate, the bulk of Todd's article was of interest to both the groups it was posted to. Harald's response was lots of fun to read, but has turned the discusion into to yet another ST vs. Amiga flame war, and belongs in alt.flame. As do any responses to that article.

If you cannot resist rebutting Harald's or Todd's claims -- as history has shown many of you will -- please edit your Newsgroups and Followup-to lines appropriately. For informative though opinionated commentary, comp.sys.amiga and comp.sys.atari is appropriate. Wanna make something of it? Take it to alt.flame. See you there.

>68010 or 68020?

Drop a 68010 in and the Operating System (TOS) dies a horrid death.
No electrical problems, just the software crashes out. The same
problem would exist for the 68020, problems multiplied many times.

You can boot an alternate OS, but then you don't get to run any
of your ST software.

I use an '010 in "that other machine". It speeds up the multiply/divide
instructions *a lot*. Other than that the increase in speed is minimal.
Since I had to replace a physically damaged 68000 in the machine anyway,
the '010 made sense.

BTW, has anyone checked to see if this system BUG has been fixed in
the new ROMS? I hate having to either 1) eat characters all the time
in my programs to avoid the problem, or 2) internally slow down the
auto repeat rate in my programs during certain operations that it
isn't nice to eat characters in (like insert text mode).

-Todd Burkey
trb@stag.UUCP

P.S. I released the Unix version of HDSCAN locally in mn.sources as a
Beta release, so as soon as I get some feedback, I will add whatever
features are necessary and release it in comp.sources.misc or
whatever. HDSCAN has changed quite a bit for Unix, so I will try to
fold some of the functionality back into the ST version. The only
negative comments I have gotten from the Unix users so far is that
one person was somewhat scared to use it, and several others would
prefer to just see their files in pure directory structure rather than
re-grouped across a tree by name, date, size, protections, etc...are
there any ST users of HDSCAN out there that want to get their two
cents worth in?

Someone out there is damned closed minded.... Since Atari owns Federated, the must only carry Atari. That's pretty brave to say on the net without checking your facts first. The local Federated here carries Apple, Atari, and yes, Amiga. They have big posters offering the Amiga videotapes so you can preview the machine (without it bombng, I suppose :-) <-- no, not a request for a flame, just something I could not withhold).

So PLEASE!!! Look at what you are saying before posting it. Maybe Federated is pushing Atari a little harder, but they still sell the rest of em.

[Facts verifiable at the Federated on March Ln, Stockton CA]

I found Neil's response to be quite refreshing. I was curious as to
why they would bother advertising the game machine so heavily and not
the ST. I am quite capable of understanding that there is no point
in advertising a product, if you are already going to sell all you
have manufactured.

I also hope that Atari notes that they are selling all the STs
they make, and decides to make more next time.

I am getting used to the fact the no matter what Atari comes out with,
the world will always assume it is for GAMES. Since I have owned
Ataris (6 of them so far..., all full blown computers, never had the
game machine, even tho' it was my original dream...), I have had to
explain to people that my COMPUTER could do anything their's could
and probably more/better. I have been doing it so long, it no longer
affects me, I have the speech down cold. (I'll even bet $ that people
who buy the Atari PC will have the same problem).

In summary, I really appreciate the information from Neil & Co.
I do view this information as fact, they are considerable closer to
the source than anyone else I know, and try to tell us as much as is
possible. While people may not like Atari's policies, I do not feel
that this is a reason to personally dump on people like Neil, who is
on our side.

602. MJC and gulam questions

Newsgroup: comp.sys.atari.st
Date: 1987-12-11 17:19:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19871211171917.3.JRD@GRACKLE.SCRC.Symbolics.COM>
Source record: 255602

In trying to use MJC for approximately real work, I've run across the following problems:

o It doesn't allow nested includes (probably because it was built with itself, and the canned LIB.C describes only 6 file descriptors)

o It sometimes gets confused about what's the name of the file it's reading, and will give you an error message with a random string (or different file name!)

o It sometimes gets confused when trying to grok struct defs, claiming that a symbol should be a close brace.

o It doesn't appear to like continuation lines (backslash terminated)

o The sizeof operator appears to be completely broken, confuses the parser.

o typedef (enum?) support appears to be spotty.

There's other wierd behaviour, but I haven't characterized it sufficiently to know whether it constitutes undocumented bugs. Has anybody else run across these things? Anybody got fixes?

On another topic, when using gulam, it occasionally bitches about something encountering some error or other, and exits with a termination code. Popular codes are -33 and -66. Is there a list anywhere of what these all codes are?

Finally, I've whacked up a cleaned-up version of the PD make program that understands how to get gulam to execute commands for it, and fixes the bug with continuation lines vs CRLF. If anyone's interested, let me know and I'll ship you a copy. If there's enough interest, I'll post it.

Thanks in advance.

A vanilla serial port is all that would be needed. Special cabling would
be required, though. But if you stuck a midi interface on any serial port
that could accept one, it would be pretty much the same. The advantage to
a serial port would be a higher speed possible, though, say, 115K baud.

Quantum Microsystems makes the ProTablet ST, which is a graphics tablet that replaces the mouse in just about every software package (there's a little desk accessory that replaces the mouse driver with the graphics tablet driver. It retails for $400. (I am affiliated with QMI, but since the ProTablet is the only product of its type as far as I know, I figured posting about it to the net would be okay. For what it's worth, I prefer the mouse...)

> 1. Does a laser printer exist? Can I easily buy one?

Yes it does exist, but only a few have shipped to dealers in the USA.
Which makes it not so easy to buy one at this moment. We are optimistic
that a better supply situation will exist shortly.

> 2. Does Desktop Publishing software for the ST exist?

Yes, there are several titles now and more coming. Right now the
favorite seems to be Publishing Partner from Softlogik. The latest
revision (1.3) of this one supports the Atari laser, as well as dot-
matrix printers and Postscript. Easy Draw 2.0 is also popular, and it
uses GDOS which makes Atari laser printer support automatic. Fleet
Street Publisher is also available, and they tell me the next rev (due
at any moment) also supports the Atari laser printer.

On the way are Deskset, a typesetting package from G.O. Graphics and
being sold by Atari; Publishing Partner 2.0 with some great improvements
and speedups; and a full-featured DTP package from Migraph (the Easy Draw
folks); but not, so it now seems, Ready Set Go, which is not going.

There's a very good one that I know of. Try the Software Plus stores. They
do lots of ST service work, and should be well supplied with spare parts.

> Also, what is the telephone number of Atari service?

408-745-2367 is the number for Atari customer relations. They should be able
to help you -- but the phones are crazy this time of year.

> Also, if I were to send my computer to Atari, will they put in the latest
> roms? The blitter?

No such luck. The only blitters so far are inside of Megas.

> to let anything out of the warehouse until the inventory was over)!

Inventory takes closer to 3 days than to 3 months. Do you remember who at
Atari told you that? We're usually pretty good about product turnaround.

I have seen all three demos. One and two seem to be early versions, each with one song. After you've seen number three, you don't need these.

If you really really want them anyway (collecting the set??) I might be able to track them down and post them to GEnie and Atari Base. But I don't think it's really worth the download time, compared to the one you have already.

If anyone out there in netland doesn't have this one yet -- fantastic music played through the ST speaker (not digitized!) and beautiful color graphics. On GEnie it's called WOWDEMO.ARC.

this posting is because I'm (and a lot other people) sick and tired of all those 'My PC is better than Yours' postings that have surfaced on both groups (comp.sys.amiga & comp.sys.atari.st).

I like to ask everyone to stop this nonsense. Please, before you post, read through you article. Think of all the consequences of your posting. Ask yourself how you'll react if you see such a flame on your favorite newsgroup flaming your favorite machine. Ask yourself if your posting will benefit others. Do you REALLY know your facts?? Do you really need to flame the other machine?

The bottom line is that no one gains from such postings; $$ gets wasted and more hatred is generated. Both the Amiga and the Atari ST have their own good and bad points. If you like one or the other, buy it, use it, and have fun with it, but PLEASE, keep those 'My PC is better than Yours' posting away from the net. Nobody likes to read such flames.

First off, if you are using the Amiga serial port there would not be any
reason to stick to MIDI data rates for your network, the medium (MIDI
current loop) could conceivably support data rates above 100K bauds.
The advantage to using MIDI ports is that the cables are a) Easy to find/build
and b) useful for something other than playing Mazewars.

Now I realize that the Atari folks don't care about the above because
they already have a MIDI port, however let me ask this. Has anyone
considered putting a MIDI adapter on the ST serial port and then
running the 'network' in the other direction? Then you could have
a counter rotating ring network that would make each host no more
than 8 hops away. Just pick the appropriate direction with :

```
DIRECTION = ((dstnode - srcnode) & 0x8) ? DOWNSTREAM : UPSTREAM ;
```

This could give added performance to time critical games.

I personally would like to thank Larry for his constructive comment concerning the Magic Sac and the proper System/Finder to run. I am sure that Larry spoke as a member of the net and not as an Apple representative, but I think that this is the proper order of things. As I see it, the net is for an interchange of information, and since an Apple employee probably knows a great deal about the workings of a Mac, it is appropriate for such a person to comment. The Magic Sac can in no way be considered competition to a Mac, so such comments cause no harm to Apple and can help a number of normal users. Besides, if we can stick to comments like Larry's, we shouldn't have as much of the computer bashing that has so recently re-erupted.

Again Larry, thank you.

Yes. No. I saw and touched the laser printer out at Comdex, but have yet to see them for sale locally. It is also available from other companies for the IBM PC, so I would imagine the delays are more supply/demand related than vaporware related.
> 2. Does Desktop Publishing software for the ST exist?
Yes. I saw several packages at the show. Publishing Partner 2.0 looked very nice (much changed from the first few versions that hit the street). For those with more expensive tastes, the 'preferred' package that Atari seemed to push was a package from a company whose name started with G.O. (sorry, my Comdex literature is all packed up for the next Atari Meeting...pretty ragged from the first one...so the names escape me). That package was expensive, but very complete. It appeared to have all the functionality of the BIG packages on the PC and MAC (in fact it is offered on the PC). Even lino-type support.

Great technical discussion there, Harald...Glad to hear that all your friends smoke dope...am sure they are pleased :-). Just so people don't get the wrong idea about MIDI-MAZE (rumor is that it will be out for Amiga). I do happen to have hunt on my Unix Box here (Symmetrics 375) and it isn't anything like midi-maze. If you want to go back in your source archives a year or so, you will see a program called MAZEWAR (early PARC days). I know it has been upgraded to run on Xwindows and it is more like Midi-maze (graphics, real perspective, etc). But even mazewar doesn't come close to midi-maze. Course, even amiga people will have to haul their computers over to friends houses. Explain to me how you can hook three graphics terminals up to your Amiga and Ethernet with all your friends??? I can only hook one extra terminal up to my ST (my Wyse while in the Multi-tasking C-Shell), but that is really only useful for editting and compiling...I can't hook other graphics tubes up (and doubt I would ever care to). I wasn't ever able to get my Wyse working as a terminal on the Amiga.

From: engst@batcomputer.tn.cornell.edu
Message-ID: <3162@batcomputer.tn.cornell.edu>
Source record: 255617

I was just working happily along on a philosophy paper when I decided to save my work (that generally being a useful function of computers). All of sudden, it said that the drive wasn't responding and continued to maintain that stance, no matter what I did. Occassionally I can boot a disk, but I can't run programs or even copy my files onto an IBM formatted disk. Needless to say, this is close to the absolute worst moment for my drive to die since I have 25 pages of writing to hand in in four days (I can do it on the Mac at work but I'm not happy about it).
So, I need information on several items. Has anyone had this problem before and found a simple fix (I have 1040 with no external drives)? I could open it up and check internal connections, but I have a feeling that won't help. Also, what is the policy on repairs direct from Atari (NEIL????)? The only dealer in town (and the only one within a three or four hour drive) just went out of business (Thanks to the new marketing strategy, the Megas and some other circumstances) so I don't really have a local alternative unless someone knows of a dealer that does repairs somewhere near Ithaca, New York (could you check your dealer list Neil?)? How long can I expect this to take? (I don't need it absolutely over winter break, but I would really like to have it as soon as possible.) Does anyone have an idea on how much a drive repair would cost, since the warranty is certainly used up? Does anyone have any consoling words?

Aaaaaaaaaaaaaaggggggggggggggghhhhhhhhhhhhhhhh!!!!!!!!!!!!!!!!

Thanks for any help . . .

Please go back and read the statement about this being an implementation characteristic of the now consistered to be crummy implementation of C they were documenting in that book. Even if they do have that restriction it is the obligation of the compiler to at a minimum warn you that such a conflict exists. What makes this a bug is silently accepting the code and generating bogus code.

Nope, that is all you really need (and all that the midi port is for
that matter...Think midi runs at around 32K Baud. On the ST it was
used more 'because it was there'. Of course, in a ring LAN like this,
you are always affected when one of the machines gets turned off or
pulls out of the ring for some reason...
>
>P.S: MazeWar is Yet Another game I'd like to work on......
Yes, I was looking at the source for that the other day (Xwindow
vers.), it wouldn't be too hard. I'm planning on proposing it as a group
project at our next ST developers meeting here in the Twin Cities.
Would be a nice winter project (plus gives us another reason to haul
our computers around). Does anyone know if it has been ported to the
AMIGA or IBM PC?

I downloaded a file called "newfont" from the houston server today, and after unpacking and the like, I ran the program, saw a page full of dutch (?) but in the end, had the characters displayed by all of the programs (windows etc.) looking like the Mac font. *Very Nice*.

I know very little about the mechanisms involved here, so maybe some kind soul out there can help.

How does one replace the system font?

How does one generate the font that replaces the system font?

Can the Font editor that came with Degas Elite be of any value here?

Finally, I've had the ST for just over a year now, and I
seem to recall that GDOS was soon to be released - Soon has long passed.
Is this still a possibility, and if so, will that help with all of this
font business?

Any help would be appreciated. (Atari?)

From: ex343@uiucuxf.cso.uiuc.edu
Message-ID: <46300001@uiucuxf>
Source record: 255624

Hi there,

I am very interested in music especially classical music. I will get a
new job soon, and I am interested in buying a personal computer. My primary
interest in the personal computer is writing music and play them on my
stereo equipment. It has to generate high quality stereo sound and has
user friendly software that I can write music with. It has to be able to
emulate various types of instrument. I also like to have a Fourie analyzer
in it. Well, in short, the more options there are the better. Note I am
not interested in doing anything else on that computer since I will have
access to a HUGE VAX cluster in my new job. The only thing I am interested
is music.

I heard that Amiga and atari are pretty good music sythesizers, but
I don't not know what kind of things I can do with it. Would some one send
me some suggestions as to which machine I should buy along with what software?
Also if you can give me a brief description of what that machine/software
can/cannot do, that will be great.
Please send me e-mail at xia%uicsrd@a.cs.uiuc.edu .

Thanks in advance.

Eugene

Actually, I was hoping that we would use the RS232 port as a 'bridge'
on the network...i.e. via modem to another 'ring' of computers. I admit
it would be a slow bridge, but 2400 baud still could get a fair amount
of packet info across for games, mail, etc. (works for USENET :-)).
I've still got the source for combat somewhere around (very early
version written in Basic, but with Gorns and the whole bit...anyone
remember back to those 110 Baud tactical shootout days?)

Those of you who have sent me request (via physical mail) for dLibs
and MicroEMACS sources, don't dispair. All requests will be filled, but
there is a slight delay. I'm trying to put the finishing touches on
dLibs v1.1 before sending out the next batch of disks. Several bugs have
been fixed, new function and features have been added (including process
control functions which use the XARG extended argument passing scheme),
and the library has been updated to conform more closely to the ANSI
proposed standard. Please be patient.
For those who haven't yet sent a request, my offer still stands. I
will mail a disk containing the latest version of dLibs (standard libraries
for C) and MicroEMACS, with source code, for $3. My address is:

------------------------------

Concerning an RF modulator for the 1040...

I would presume that one exists. Let me explain.

I think that the new 520 ST's are actually 1040's with half the memory
pulled out, a single sided drive instead of a double sided drive, and
an RF modulator added in.

So... If you want an RF modulator for your 1040, just order a new one for
your 520ST-that-blew-out-its-rf-modulator!

I don't know for sure if this would work because I have not opened up the
new 520ST's , but maybe someone that has access to both could open both
the new 520 and a 1040 and let the rest of us know.

More specifically, it's a piece in Bach's _Musical Offerings_. Each
of the pieces are intriguing in their own right. I'm not knowledgeable
enough in music theory but I recently perused over a book that was devoted
exclusively to anaylyzing _Musical Offerings_. Very interesting!

The piece starts on one key but after the piece nears the 'end',
it has changed to another key, and the 'end' of the piece runs smoothly into
the start of the piece, this time with the new key. The key goes on changing
until you've reached the original key, and so on and so on and so on and so...

A similar work (without the key changes but with the tail -> head
sort of loop) was done by Chopin. I can't remember what it was called,
though it was a piano piece (big surprise! - for Chopin :-)
If anyone is interested, I can dig it from my notes...

>(Richard Sexton) writes:
>
>See Johann Sebastian Bach's "endlessly rising canon". This is a very old
>illusion, based on the fact that a note sounds very much like the same note
>in the next octave.

More specifically, this is a piece called "Canon per Tonos" and it's
in J.S. Bach's _Musical Offering. The canon is able to repeat itself because
Bach made the 'tail' notes of the canon flow smoothly into the 'head' notes
of the canon. More importantly, the canon starts in the key of C minor
but when we near the end of the piece, it changes to the key of D minor.
So we keep on playing in the key of D minor but when we near the 'tail' again,
it changes to E, and so on and so on... Eventually, it reaches the key of
C minor, to start all over again!

Bach's _Musical Offering_ also contains other interesting pieces
too. Check out Hans Theodore David's _J.S. Bach's Musical Offering_ to
see how involved and beautiful this collection of musical delights is!
The book is devoted exclusively to the analysis of _Musical Offerings_.
Bery bery interesting...

Another piece which repeats itself is Chopin's _Mazurka in F minor_,
opus 68 posthumous (1849). You can play this piece without end, though it
doesn't have the neat key changes that "Canon per Tonos" has.

I posted a query for any pieces the net-readers know about that are
similar to these, but the response so far has been under-whelming. Oh well.

639. Magic Sac System/Finder, etc.

Newsgroup: comp.sys.atari.st
Date: 1987-12-14 11:29:13 UTC
From: fireplace@cup.portal.com
Message-ID: <1995@cup.portal.com>
Source record: 255639

The only problem with using System 3.2/Finder 5.3 with the Magic Sac is a cute "disk eject" problem. Selecting eject from the pull-down does absolutely nothing. I know it works fine on a real Macintosh. Is this a problem in Finder or the Magic Sac? Larry, any idea? I currently use an odd combination (System 3.2/Finder 5.4). This way I get the suggested System and a better Finder without the "disk eject" problem.

*** Changing thought pattern *** I received my Translator One last Friday. I can now format/read/write any Macintosh disk. It really works and is worth every dollar. Now I will never have to "null modem" files to/from Macintosh again. If you are a serious Magic Sac user, you need a Translator One. The new revision (5.5) of the software now supports Hard Disk 20. I have HFS up and running with System 3.2/Finder 5.4 without any problems. The Magic Sac just gets better and better...

From: alg@btnix.axion.bt.co.uk
Message-ID: <642@btnix.axion.bt.co.uk>
Source record: 255640

/\oo/\

Various reference guides mention that Timer A in the 68901 is available for user applications, and is thus left alone by the system. Great, just what I need. For the life of me, I cannot find any references stating the rate at which the timer clocks. There is a 2.??MHz Xtal and a 4MHz clock input to the device. I was told that an application can use a 1 mS timer but this doesn't seem to be of much use to me, since I need to resolve down towards microsecond precision.

Anyone out there in netland know the answer.

641. Colorburst - Mostly hype!

Newsgroup: comp.sys.atari.st
Date: 1987-12-14 15:22:09 UTC
From: wayneck@tekig5.TEK.COM
Message-ID: <2246@tekig5.TEK.COM>
Source record: 255641

Well I saw Colorburst on the shelf Saturday and bought a copy. That afternoon I played around with it. Now I feel that all the talk about Colorburst is mostly hype. I'll try to be polite, but the kindness thing I can say about it is that it is a ripoff. If the program had only cost $10 to $15 dollars I would have been pleased, but at $35 to $40 dollars I feel that some people are trying to make a fast buck.

First is the author's defense, I have one of the earliest ST's. I doubt if that make any difference, but there is always a chance I guess. Okay, so why am I so upset? Here is why!

1) Yes, you can choose from 3375 colors, only from what I can see only 512 of them don't flicker. I played around with setting the background colors to the new shades. Maybe I didn't do it right since the program is VERY hard to use. The user interface seems to work only part of the time. Anyway the color always flicker when ever I got away from the basic 512 colors.

2) Yes, you can have 800 colors on the screen at one time, BUT ONLY 16 COLORS PER 4 SCAN LINES. That just doesn't cut it. Note Spectrum gives you over 40 colors per scan line.

3) The editing program is awkward, slow and sometimes seems to leave my computer messed up. Ugh! The user interface just doesn't work well, the "Zoom Edit" mode were the colors are set is a horror to use!

4) For only $25 more dollars I could have had Spectrum 512! I blew it.

The floppy disk has a label on it that says "Serving the Software needs of the world for over 6 weeks." and quite frankly the program shows it. So in the case of Colorburst, unless it fits a very quick and special need, I say save your pennies and buy something else.

Message-ID: <2069@charon.unm.edu>
Source record: 255642
Cross-posted to: comp.sys.amiga,comp.sys.atari.st

I was kind of curious on a certain possibility..

On an earlier Fred Fish disk, there was a listing on how to interface
an ibm pc with the amiga through the parallel port and send data
19.2k baud back and forth.

Has somebody yet created a modem that allows use of the parallel port
amoung amiga computers or others?

I would think that you could allow many more "serial" ports using the
parallel port, and at least expand the capability of more modem
hookup over the phone lines...

I have a feeling that there might be a software problem right at first,
but with everybody on the net writing excellent software, that would
solve that problem. I am not a hardware hacker so I do not
know if this will work or not.

Please reply on the net as a general post so everybody has a chance
to respond.

From: jfp@mck-csc.UUCP
Message-ID: <11@mck-csc.UUCP>
Source record: 255643

I'm helping my younger brother out with a C compiler for a Xmas present ...

Unfortunately, I know little about the world of 520 STs. Could anyone
out there please give any advice on the available C compilers. I have
seen Lattice available at one of the local stores (published by METACOMO),
it's a familiar name from PC land, but who are there METACOMO folks?
Does this one work, are others better (for a student programmer at college,
interested in programming and capable for a freshman).

Another issue is that his current machine has but a single floppy. Is it
even practical of compile/link with a single floppy drive? I've done it
on PCs but ....

What about the world of hard drives? The local establishment had an Atari
20 meg model available for $670 .... this seems like too much for a
"consumer grade" 20 meg hard disk these days ... Is this an acceptable
drive (reliability, speed, etc.) or are other choices available ....

While we're at it, any good game selections ....

Thanx for any help ....
Please reply by e-mail to ..!mit-eddie!mck-csc!jfp

I don't know where else to post this and since the problem came
up with a ST program, here goes.

I am the co-sysop on a local BBS and I save xprolog from this newsgroup
with the intent of offering on the BBS.
So I saved the program and when I tried to UUDECODE it, I got
the message 'short file'.

What does this mean? Did anyone else have this problem?

The Beckemeyer Development Tools MT C-Shell system can support up to 12 users, with an expansion box, which plugs into the Atari ST serial port. Call the company for pricing.

These products are available NOW and many installations are up and running around the world.

Sounds like the proverbial "loose chips" problem. Open up the 1040, press down on all the socketed chips, and chances are your drive will magically start working.

could someone please mail me a copy of the docs which go with the program
FOLDRXXX? i know how to use the program, but before i upload it to my local
bbs, i'd prefer to have the 'official' docs that go with it. Atari _has_
officially released this, right? Neil? it might be a good idea for someone
to post the docs to go with the executable that was posted a few days ago,
but to prevent multiple postings i'll do it when/if my copies come in the
mail.

thanks in advance,

greg

From: norvelb@skat.usc.edu
Message-ID: <5710@oberon.USC.EDU>
Source record: 255650

This is a reply to the request for ST demo .

First an Introduction :
Rob Hubbard is a music composer for video games (he did his best work on the c-64) .
Then came people who cracked games and put their names in the presentation page and then redistributed it .
That wasnt enough for them .
They went further by ripping off the music theme of these games and incorporating them in their screen hack demo . (rob Hubbard , Daglish, and t. Crowther are the favorite composer these people like to rip the music score from)
(these groups are in europe, the best known are german ...)

How come you have never seen games with these music score before ?
well these game-music composers are from england, producing for english game that seldomly see light in the states .

so :
The only way to get these games (pirated) and demos (these cracker really push the machine to the limit in their display hack) is by calling these pirate bbs.(there are bbs specialised in importing foreign cracked games, no need to say that these people are really well organised)

It seems that pirates that were on the c-64v are moving to the ST machines ....

I dont have to say that this is illegal : I am just reporting the facts .

(who would in his right mind work his bunns off to do a demo and put a handle instead of a REAL name .. I know, I know ., there are some exception ...)

well you now have a global view of what is happening ...

---

these ideas are mine alone .

I would like to request some information from anyone who has done this. I am interested in building a hard disk system based on something like the BMS ACSI to SCSI DMA converter. I would like to know what one would need besides the board (such as cables and type of hard disk system) to get a disk going. Also, what other boards are there like the BMS board?

Please e-mail any responses to ud138985 at NDSUVM1. Thanks in advance for any replies.

Bob

However, a Federated employee told me a couple of days ago that some change in the stores' product line *may* take place after the first of the year. This was just one unofficial opinion, but it makes one wonder what Federated may do now that Atari owns the chain.

My opinion is that there are better places to buy computers than a chain of stores specializing in stereos and T.V.s. But that's just my opinion, don't forget.

Bill

Wouldn't it be easier just to save the palate values and set them ALL
to black (000) ? Then a keypress could cause the old values to be
restored. This (it seems to me) would always work. Color or Mono.
No moving the video RAM pointer. No need to check 32K for zeros.

...or am I forgetting something?

>and a waste of money. But we all know that.
>
I don't think so. The Atari and Amiga both have qualities that the other
lacks, but the atari is not a waste of money. It depends on what you want
to do with it -- The amiga makes a lousy cash register... I know, I've
seen it. The ST makes a lousy music box, but a very good MIDI computer.
>
> I would too if the machine and OS did nothing. I always wanted ZERO
>colors in high resolution mode. Oh wait, thats black and white, right?
>
You must be one of those people who can work for hours in front of a color
monitor. I am not one of those people. I have a higher bandwidth than
that. 60 Hz is still annoying, 70 Hz is barely acceptable. Color monitors
are hard on the eyes, but Amiga doesn't have a monochrome monitor. Sure,
you can attach one, but without a non-color mode, the resolution and
screen refresh is no better. For music control applications, most word
processiong, and a majority of non-game activities can be done just fine
with two colors.
>
> So why on earth do you have an Atari?
>
1) Software is cheaper and more stable.

2) The monochrome monitor's 70 Hz refresh is much easiser on my eyes.
3) When I bought my Atari ST, the Amiga cost about 3 to 5 times as much.
4) Every time I've gone to look at an Amiga at the local computer shop where they push the Amiga much more than the ST, the demo copies of the software are ALWAYS corrupted because the Amiga multi-tasking really screws up royally on a single drive system and corrupts disks left and right.
5) Application startup is usually very slow.
6) I've worked on good graphics systems that would leave you amigoids crying into your HAM images, and know more about graphics hardware than most of you. The Amiga is a limited purpose machine because it has such a great video and audio capability that in order to utilize the hardware, you really must fit your software to the hardware. This is fine for games and graphics of sorts, but not great for general purpose computing. I'm trying not to flame here...
>--

I'm not even going to go into your false statements about Atari and Federated coporate policy. Don't talk so smugly about things which you only assume. Until you know some of the facts, don't claim to know the one true way. Enlightenment comes not to those who insist that they are already enlightened thus blind themselves.

What I want to know is why you Amiga people insist on coming over here to constantly flame the ST, and then attack anyone from here who goes into amiga territory and flames the Amiga.

If you think we are all such fools in this group for owning Atari STs, then let us be fools. We know about your wonder machine. You and it can go and rot in peace, for all most of us care. We have made our choices. It is not for you to say if our choice was right or wrong, it would have been wrong for you, and that is fine, but I wish to any god that might be listening that you and your friends would

S H U T T H E H E C K U P ! ! ! ! ! !

Leave it be. Let us live in our folly before we come over and dump all over your front lawn and dig up your daisies!

I have the new ("blitter") ROMs in my 1040, and have noticed the same behavior
when booting (I have a Supra disk, with their hard disk boot program
installed). Anyone have a guess as to why? (hello, apratt?)

> >I am also using GEMBOOT to overcome the 40 folder limit in TOS(has it been

> fixed? Or is it 40 folders DEEP?

Au contraire, the question has been answered here before in a definitive
manner. That answer is: NO The blitter ROMs do not fix the 40 folder bug.

The 40 folder bug refers to a problem where a filesystem on a hard disk or
diskette can become corrupted if more than 40 folders are accessed during
any one "session" with an ST ("session": period of use between re-boots).
A well-known workaround is the recently re-posted FOLDRXXX.PRG. Change XXX
in the program name to the number of folders you think you're likeky to
access during any one use of the machine, and stick the program in your
\AUTO folder, and re-boot.

I have heard from other netters that this bug is due to memory not being
freed-up when you jumo into and out of folders (directories). Correct
me if I'm wrong on that...

660. ST software available for children?

Newsgroup: comp.sys.atari.st
Date: 1987-12-15 16:01:54 UTC
From: jholbach@wright.EDU
Message-ID: <206@wright.EDU>
Source record: 255560

Last year I purchased a 1040ST primarily to use as a terminal
for working at home. Now that things have slowed down on the projects
I was working on, I have time to explore using the ST with my children.
So far however, I've not been very happy with the software I've found
(not found? :-) for the ST at local dealers.
I don't have terribly specific ideas of what I'm looking for
(although I'm really sure I'll recognize it when I *see* it :-), but
I'm looking for software of various kinds (i.e. educational, games or
combinations of the two) to interest/amuse/even perhaps teach an
eight year old and a four year old. So far, everything I've seen seems
to be oriented to some other market than these ages.
Can anybody give me some recommendations based on personal
use? (I really wonder how dealers sell any software when they refuse
to have demo copies so you can see what the heck you're supposed to
be buying...) In particular, anybody know if software such as
"Rocky's Boots", etc. has ever been ported to the ST?
I like my ST, but the software situation has me to the
point of seriously considering buying an Apple II or IIGS for my
kids. Any recommendations would be greatly appreciated.

Jim Holbach

> on that.

Phhhlpbb!

The new ROMs (dated Feb 14, 1986 and onward) contain pointers to the
critical Gemdos variables in the ROM header, and FOLDRxxx knows about
them. No need to patch. The larger pool in the new ROMs does NOT make
the utility superfluous, and could even be considered a misfeature,
since it rips-off another 8K from the initial TPA size. I know of some
applications that failed on 512K machines because of the "missing" TPA.

I think that the recently posted
kmpfix.c -- Utility for Gulam

that was posted 1987 12 13 with the subject line

"v00i049: mwc:all: GULAMFIX - keyboard mod program for gulam shell"

solves these problems.
It was written by Prabhaker Mateti, the author of Gulam.

> there are any problens putting these nice new 24-pin printers on an ST.
> I would guess that for pure text output and normal word processors
> there is no problem. However, what about
> 1. screen dumps
when i fisrt got my P9 (24-pin Nec), I gave my tech manuals to someone
(name withheld to protect the innocent) and asked if he could write me
a driver, time passed and software didn't so eventually I took back my
docs. Perhaps if we (24-pin) owners all asked.....
as to screen dumps.... write your own and oh by the way when you're
done could I have a copy (;-) ?
> 2. word processors including graphics (First Word Plus etc.)
since the Nec is esc code upward compatable, the basic modes (italic,
bold, etc) all work. again do graphics
> 3. desktop publishing systems
most of them now support 24 pin printers, i use Word Perfect (under
PC-ditto) and it support the P7/9

>
> Many thanks for any help.
> ps. Any suggestions as to the "best" 24-pin printer?

my biggest complain with the P9 (and most NLQ printers) is that they are
not built for high volume output, the P9 has no sprocket feed and the paper
tends to drift to the right page by page. Other that that the quality
is excellant and the power (fonts, speed, etc) is excellant.

P.S. they do make a sprocket feed adapter for another $78.

Message-ID: <17072@topaz.rutgers.edu>
Source record: 255564

I don't know if I would recommend Lattice C. I liked it on the IBM, but once I bought it for my ST , I ran into bug after bug. It was barely useable for classwork, I was able to code around all the bugs in the small few hundred line school programs, but for hacking there are TONS of bugs in the gem interface, it is too strict on typing (I might as well use pascal).

For the record, I have version 3.1. There is a newer version out which includes a resource editor. I am waiting for Laser C from Megamax.

665. info on gdos

Newsgroup: comp.sys.atari.st
Date: 1987-12-15 20:17:15 UTC
From: cyliax@ea.ecn.purdue.edu
Message-ID: <1304@ea.ecn.purdue.edu>
Source record: 255565

I need to find some information on Gdos. Mainly information on how to use it and how to write drivers for it. Also if there is a way to have it write stuff into a file so I can upload it and write a filter for it to convert whatever format it has to a more usefull graphics language.

The goal of this exercise is to be able to use something like Athena II, which uses gdos, and be able to plot stuff out on a real plotter at school, which is hooked up to a Vax running Unix.

Thanks,

>I have seen all three demos. One and two seem to be early versions, each
>with one song. After you've seen number three, you don't need these.
>
>If anyone out there in netland doesn't have this one yet -- fantastic music
>played through the ST speaker (not digitized!) and beautiful color graphics.
>On GEnie it's called WOWDEMO.ARC.
>--->Neil Harris, Director of Marketing Communications, Atari Corporation

Well, I hadn't seen this one before, so I downloaded it from a local BBS.
(It was called ROBB.ARC). When I ran the program, however, I got what
looked like about 8 screens flashing back and forth madly. The music
worked just fine. The ARC tested out just fine, and I even got it from a
spearate source, but the strange behaviour remains. The effect reminded
me of a TV when you turn the horizontal hold knob way too far :-).

Anyone guess what's wrong?? This is a 1040 ST, and I had NO accessories,
ram disks, etc. active at the time. Maybe the same bad copy was uploaded
to several boards....

667. Re: Colorburst - Mostly hype!

Newsgroup: comp.sys.atari.st
Date: 1987-12-15 20:48:40 UTC
From: cmcmanis%pepper@Sun.COM
Message-ID: <36598@sun.uucp>
Source record: 255567
Cross-posted to: comp.sys.atari.st,comp.misc

In article <2246@tekig5.TEK.COM> (Wayne Knapp) writes:
> Well I saw Colorburst on the shelf Saturday and bought a copy. That
>afternoon I played around with it. Now I feel that all the talk about
>Colorburst is mostly hype. I'll try to be polite, but the kindness thing
>I can say about it is that it is a ripoff. If the program had only cost $10
>to $15 dollars I would have been pleased, but at $35 to $40 dollars I feel
>that some people are trying to make a fast buck.

Wayne goes on to describe the deficiencies of ColorBurst which have been deleted for brevity. His primary complaint is that all of the colors other than the original 512 flicker, this is due to the ST's inability to display more than 512 colors without relying on aliasing effects of the CRT. Look at the schematic, it has a 9 bit DAC, that's 512 colors period.

I can really sympathize with Wayne's complaints but I have to wonder about the underlying reasons one would buy something like ColorBurst in the first place. Over the past 15 years I have talked to a lot of people who have decided to 'take the plunge' and buy a personal computer. Many of the saddest tales I heard came from college students who wanted one thing but could only afford another. The second saddest tales come from people who bought a computer, only to find out that either it couldn't do what they wanted, or once they had used it for a while they knew what they really wanted in a computer and it wasn't what they had bought. I don't know if Wayne is in this situation, however I do know that some fraction of the people reading this list are in the "I'm going to take the plunge" stage and maybe some warning/information will help them.

So herein are some free guidelines for the computer buyer :

* Write down on a piece of paper what you want your computer to do. Rank these in a priority order. Try to think of at least 10 different things.

* Go out and look at as many computers that you can find, if you know someone who owns a computer of the type you are considering, take your list and ask them if they *have programs* that will do any of those things. Computers have this wonderful *potential* but try to see what actually exists.

* When you have limited your choices, check out the hardware specifications for the computers you are looking at. Look at CPU speed, graphics resolution, disk capacity, expansion capability (check existence here too, since anyone can say "Sure you can plug an 8 meg board in this here plug." but what you need to know is "Manufacturer Glitz makes an 8 meg board available *now* to plug into this here port.") Something to

remember is that if the computer you are looking at is new or an off brand the only expanision you may ever get for it is what is available today. Also look at sound capabilities and alternative I/O devices (can it support a Joystick? a digitizer? a mouse?)

* Compare these things to what you want to do with your computer and see if those things require any "extra" options. Then price computers with similar capabilities. For instance if your list requires 640 X 400 color displays don't compare a $500 monochrome PC clone to an Amiga, compare a $500 clone + VGA montor/interface to the Amiga. Compare systems with as similar capabilities as possible.

* Ask yourself, "How important is it that I have this computer now?" If you wait there will always be another computer or model that does more for the same price in about 6 months. If you can wait 6 months then do so, you will be happier. If you decide to buy a computer now, make sure your reasons are good ones, because if they evaporate under close scrutiny then when the new model comes out you will feel bad that you didn't wait.

* If there other people in your life that have a computer, check to see how compatible your two machines are. If you like to program and share projects it is easier to do so if the your machine is compatible.

* Most importantly, if some computer is 'close' but not quite what you want then DONT BUY IT. You are asking for trouble later on, simply because you will have invested so much money in it. This is the root of a lot of flames here on Usenet. Did you ever get into arguments in high school about which kind of car was better, like Ford, Chevy, Nissan, etc? I remember arguments like that well. The biggest problem was that if you owned a Ford and were arguing with a Chevy owner, neither of you could back down in good concience because that would mean admitting you had spent two summers worth of savings on an inferior car. When in fact, you had done no such thing. You had bought a car that you liked, and thus is the *best* in your *opinion*. Since there isn't a Car in a vault somewhere certified as the absolute best car in the world there is no basis for a valued comparison. Understand this, and agree to disagree, and your blood pressure will stay a lot lower.

Some Don'ts when buying a computer :

* Don't buy a computer on impulse, it is almost always the wrong computer for you.

* Don't believe anything that a salesman tells you about 'other' computers. They probably know less about them than you do.

* Don't buy a computer because someone says it can do something if there isn't a program available that does it.

* Don't lie to yourself about how you will use this wonderful machine to make your life easier. If all you want to do is play games then be up front about it. It will save a lot of guilt feelings later.

* Try not to buy a computer on credit, save your money and buy it with cash. Otherwise you may find yourself paying on the old one when the new model comes out. More guilt feelings.

* Don't buy a computer to learn programming. If you ever want to program a computer you own, learn programming *first*. Then you will know when the programming environment a computer offers is usable.

Anyway, this is a boiled down version of much of the advice I give people when they ask "Which computer should I buy?" Hope it helps someone out there from being burned.

Message-ID: <1928@utx1.UUCP>
Source record: 255569

Hi there, this is my first posting to the net. I have been a silent reader for a long time. Since I haven't seen discussions on this topic, I have to bring it up myself.

I like to make a memory upgrade board for my ST. I like to have suckets that will hold both the 1Mb chip and the 256k chip and use jumpers to configer the two configeration. I such a way, I could use 256k chips for now and the 1Mb chips in future when the price comes down.

Please help:

1. Where can I possibily obtain a schematics drawing?
2. Has anybody done this? Can we share your experience?
3. Any reference articles, materials, whatever related?

I will make it a mini-project and I will summarize all the messages and post them along with the outcome and my experience.

Please e-mail your response to me.

Thanks in advance!

P.S. I know E. Author Brown Co. sells a 1.0 - 4.0 Mb ready made board for $199.99. What a rip off! ;-|.

>
>I also hope that Atari notes that they are selling all the STs
>they make, and decides to make more next time.

"..next time"? This is what I don't understand. Correct me if I am wrong, but I thought products such as microcomputers were turned out on assembly lines that can be kept running, even at a low production rate, on a more or less continuous basis. The "..next time" concept makes sense if you are talking about a press run of books. If an automobile company sees that its cars are selling as fast as they can be made, a second shift is put on at the factory to produce more to meet the demand. In other words, the assembly line is reved up to a higher production rate. Why can't that be done with Ataris? And what is the "..next time"? Does Atari have to wait till Christmas '88 to order more ST's?

This is a serious question, not a rhetorical one. Anybody have any ideas?

Bill

672. general info on disk drives wanted

Newsgroup: comp.sys.atari.st
Date: 1987-12-16 02:00:01 UTC
From: engst@batcomputer.tn.cornell.edu
Message-ID: <3197@batcomputer.tn.cornell.edu>
Source record: 255572

In light of my recent disk drive failure, (which seemed to go away briefly and has since returned), I'm looking for a second drive or hard drive so I'm not so dependent on the internal drive. (I had to write a 15 page paper on a Mac and nearly lost it twice. My next paper is being written on an AT, since I trust WordPerfect 4.2 a bit more than anything within ten feet of a Mac.) Does anyone have any experience with the Astra Hard drive/floppy combo? It seemed like a good setup and was reported as being very durable. Alternately, how easy/economical is it to put together a system from various parts (ie buy a drive and a controller and power supply and stick 'em all together)? Are any other hard drives especially recommended? I personally think the Atari hard drive is too big, but I haven't heard any reports on price comparisons or reliability. If enough people respond via e-mail, I'll post a summary to the net. Remember, there is nothing worse than being forced to use other computers because the ST failed. So please, send information to me. Thanks a lot!

Well, shoot. Do we tell 'em now ? Aw hell, might as well.

Well, the REAL reason there isn't s MIDI port on the Amiga, is because
it would have interfered with PSI-net (tm), the telepathic network
driver developed by Sunny Kirsten. So you see, Amiga people don't need
to shuttle their machines around in the cold and snow just to play silly
games.

Ooooooooooommmm.

Message-ID: <2151@crash.cts.com>
Source record: 255575
Cross-posted to: comp.sys.amiga,comp.sys.mac,comp.sys.atari.st,rec.music.makers,rec.music.synth,rec.music.classical

As I remember, the original question asked for an endlessly rising tone. These various plays on cyclic nature of the western scale achieve a similar effect, but are not quite what was asked for.

Western music is based upon a 12 tone system. These tones are sub-divided into sets of 7 notes which form scales (usually 7 notes). These subsets form alternative contours. When progressing through the keys rather than moving in one tone steps, the 5th member of a given scale forms the next most obvious key. By doing so the scale being changed to will contain only one note not found in its predicessor, which explains why it is the next obvious key. This is layed out clearly for the ear in J.S. Bach's studies of the well tempered scale.

Taking this into account, it should be possible to derive any number of always rising progressions. Of course doing so in an artfull manner requires skill, insight, and talent. What I find fasinating about Bach's work is the precise control of multiple modes of the keys.

Interestingly enough, the well tempered scale is not true to the ear. IE: if I tune my guitar by ear to a given major scale, it will sound fine in that scale, and its cousins, but degrades with distance from the original root. Clearly the well tempered clavier (spelling?) is full of consistent distortions to make the circle of 5ths fit. At least I think this is so. Any knowlegable theory experts care to enlighten me?

Thanks,

Wade.

Cross-posted to: comp.sys.atari.st,comp.sys.amiga

Time for a bit of heresy, I thought. I'm well aware of what multi-tasking does and doesn't do for you. I use it all the time on the mini's and mainframes at work. Nice.

But, I question its usefulness (and even desireability) on typical 'home computers' in a 'home' environment -- and let's face it, that's where most of the Amigas and Ataris sold end up. What I am questioning is TRUE multi-tasking. I've got no argument with 'carousels' of suspended programs, and no problem with resident background interrupt handlers, such as print spoolers.

So, what's my problem? Well, I think that the usenet bunch is unrepresentative of your 'standard canonical' machine owner. Most of the machines out there are going to be basic one or two floppy systems (including mine -- I'll just mention in passing, that with present pricing, the cheapest way for me to get a hard disk, by far, would be to buy a clone of an IBM PC -- and, they'd throw in the 'computer' free :-).

I have an image of telling my machine 'make fred', and then letting it get on with it while I do a bit of word-processing, or whatever. Only to be hit milliseconds later with an alert box:

BACKGROUND COMPILATION NEEDS LIBRARY DISK
PLEASE INSERT LIBRARY DISK INTO DRIVE B

and, a second or two after I do that:

FOREGROUND PROCESS NEEDS AUTO-SAVE DISK
PLEASE INSERT DISK INTO DRIVE B

and so on, ad infinitum. Doesn't feel profitable somehow, and definitely full of space for making nasty mistakes in the disk swapping.

I can't think of *any* two tasks which I do on my home machine which take enough time to make m/p profitable, and which could co-exist sensibly with only two floppy drives. I suspect (OPINION, MINE, MY VERY OWN) that the same is true of the usage patterns of MOST home machines -- and, again, I emphasize that I think this present group is unrepresentative, and very much a minority.

(And, maybe I'll feel differently if I ever manage to save enough pennies to buy a hard disk -- or, maybe even a couple of Meg of RAMDISK would do.)

677. CHMOD F_ATTRIB

Newsgroup: comp.sys.atari.st
Date: 1987-12-16 11:48:38 UTC
From: neil@cs.hw.ac.uk
Message-ID: <1592@brahma.cs.hw.ac.uk>
Source record: 255577

Here are some weird things I found out while playing about with
CHMOD/F_ATTRIB (GEMDOS $43)

1. The PEXEC (GEMDOS $4B)function will not execute a file with its
hidden(bit 1) and/or system(bit 2) attribute set.

2. If a file is hidden/system it does not show up on the desktop windows
but if it's also read only then it will show up.

3. A file can be changed into a directory or volume label but can't be changed
back again.

Comments anyone ...

679. Re: ST software available for children?

Newsgroup: comp.sys.atari.st
Date: 1987-12-16 17:34:39 UTC
From: georgew@tekig4.TEK.COM
Message-ID: <2259@tekig4.TEK.COM>
Source record: 255579

Well, I can't recommend anything, but if anyone finds something, I'd be interested in hearing about it. I have two 5 year olds, and the only thing they consistently enjoy is NeoChrome. I acquired some public domain games (Mr. Potato Head, Old MacDonald's "Concentration", a couple "music for children" games), but they're not very interactive ("click on a square to select an action"), and the kids had absolutely zero interest in them, so I would recommend games where the mouse or joystick moves something besides just a cursor on the screen. I haven't looked in stores lately, but when I did, I was not impressed. Now that Toys R Us has stopped carrying the ST, I don't hold out much hope for seeing any decent children's stuff.
It should be a lot easier to find something for a child who can read (something similar to King's Quest?) Also, everything I've seen runs in low-resolution, so you'd better have a color monitor.

I think it depends a lot on the child: A five-year old friend came over, and we finally had to drag him off the machine, because he's a video game addict (he plays space war games as well as I do!)

680. Atari 800 disk format questions (?!)

Newsgroup: comp.sys.atari.st
Date: 1987-12-16 17:35:05 UTC
From: lansd@godzilla.ele.toronto.edu
Message-ID: <1987Dec16.123505.8410@jarvis.csri.toronto.edu>
Source record: 255580

(I previously posted this to comp.sys.atari.8bit, but did not receive much response. Maybe some ex-8 bit Atari owners can answer my questions...)

I am just finishing up a program for the Atari-ST that turns it into eight disk drives and a printer for the Atari 800 (and successors).

The package consists of a simple hardware circuit that connects the 800's serial bus to the ST's serial port and a file server program running on the ST. This software monitors the serial port at 19kbaud for commands from the 800, and services these requests using its local resources.

At the moment the program can only handle single density disks, but I would like to upgrade it to double density (256 byte sectors). The only problem is that I do not own a DD drive and my Atari 800 documentation does not mention DD disk info anywhere. Maybe someone can answer the following questions for me....

1) How does the Atari 800 know when a drive has a SD or DD disk in it?

2) Would I be correct to postulate that the drive writes 256 byte sectors, but to the Atari 800 the one disk sector really looks like two logical sectors? Ie. the disk separates the 256 byte sector into 128 byte sectors for transfer. The reason I see it this way it that the Atari 800 expects 128 byte data packets from its serial bus.

3) Is the VTOC bit map in terms of 128 byte sectors or 256 byte sectors?

4) Is the VTOC still at logical offset 168hex (128 byte sectors), or 168hex (256 byte sectors).

5) On a DD disk what is the value of VTOC locations at offset 1 and 2 - the maximum sector number (under DOS 2). This is at sector 168 hex.

6) Would I be correct to say that the 800 sees the disk as 128 byte sectors and only knows that it is DD by the larger number of disk sectors per disk as indicated by VTOC bytes 1 and 2?

>configuration;

I also saw the blurb about the A3000 on the Computer Chronicles show. The interesting thing about this is that, not only is this show heavily PC and Mac oriented, they very rarely mention rumors. Their computer news segment deals almost solely with PC and Mac product announcements. What they called an A3000 did sound a lot like an A2000 packed to rafters with boards. But, they did already announce the A500 and A2000 a long time ago. You all realize that this is the second week in a row that they've mentioned Amigas in the news segment. I see a trend here. Also, they are using an A1000 in the background of the software review segment (a screen that says 'Software Review' and the name of the program), unfortunately they never review Amiga software. Hey, C-A! It's time to get some C-A people on the show to show off what an A2000 can really do, especially to those business types. Right now they think that all you can make an Amiga do is run Boing! and Robocity at the same time (as shown on the Amiga vs. Atari show they did in June '86). Put a demo together that will make even Stuart Chefiet chuck his PC :-).

682. Which ST to buy?

Newsgroup: comp.sys.atari.st
Date: 1987-12-16 17:47:59 UTC
From: RUBIN@GRAF.POLY.EDU
Message-ID: <8712161809.AA12111@ucbvax.Berkeley.EDU>
Source record: 255582

OK... after a year of thinking about which computer to buy I've finally decided to go for an Atari ST.

What I basically want to know is which one to get. I will be using the computer mostly for MIDI applications in my home studio. I would appreciate it if someone can explain the major differences between the 520, 1040, and Mega ST's, and what I should expect to pay for each. I am also tying to decide whether a monochrome or color system would better suit my needs (I would like to avoid the eye strain of a color monitor, but I hear that certain programs will not run on a monochrome system).

For those of you who are actually using the ST for MIDI stuff, I would appreciate any comments (good and bad) on the various sequencing and librarian programs that are available. Also any general comments on the Atari and MIDI would be helpful.

> So... If you want an RF modulator for your 1040, just order a new one for
> your 520ST-that-blew-out-its-rf-modulator!

Nice try. But the installation of a modulator is no small feat -- not only
are there many many solder points for the modulator itself, but there are
components which are not present in the 1040 that would need to be added
inside the shielded part of the board which contains the video shifter.

Also, we do not sell components, but rather we offer replacement
motherboards to service centers.

The "40 folder limit" bug hits when you try to access more than 40 folders
within one interval between reboots. I assume you aren't using some form
of incremental backup program for your HD if you haven't seen it yet.
It IS in ALL versions of the ROMs. Its cause is a logical flaw in the entire
memory management scheme for the ATARI ST.
Its symptoms are trashed directories on you harddisk (and I believe random
lockups or reboots).

Good analogy, because to fix the display all you have to do is twist your
vertical hold knob (clockwise, I think, but experiment with it). The demo
puts graphics above the normal top of the screen, so the ST gets a bit
confused about how big the screen is. It IS possible to adjust your monitor
so that you can get a good display both inside and outside the demo (but
you have to get the vertical hold just right...)

> the underlying reasons one would buy something like ColorBurst in the first
> place. ... (What followed was a good list of things to watch out for.)

I'm afraid that I wasn't clear in my first posting. My complaints with ColorBurst aren't due to the limits of the ST hardware but are due to the program it's self. If feel the ST 520 is an excellent machine for the money. Actually the Amiga 500 is also becoming a fine buy. But this machines do have some limits.

ColorBurst is limited by the machine it is limited by it's self. The program could have been great on the ST but I think it may have been just released too soon. The reason why the colors outside of the 512 flicked is due to the fact that the program was switching between the two color shades too slow. ColorBurst doesn't use any kind of dithering for new colors, but inside changes the shade every 60th of second. The two shades blend together and sometimes will give a reasonable inbetween shade. Only ColorBurst seemed to be either missing vertical blanks for color swithing or was using two shades that were two far apart in intensity, hense the flickering. I know it is possible to do what ColorBurst claims as I wrote (long before ColorBurst) a simple program that allows some of the same effects.

The problem I have with the program is that is doesn't seem to be a reasonalbe working program. If it had done what it claimed, (which the ST can do) then I would have been happy. Instead the program is either buggy or just too hard to use both leading to the same problem. But one thing Chuck is sure right about, I should have looked before leaping.

Wayne Knapp

P.S. Actully the reason I bought the program was that I'm porting some Amiga amination programs to the ST. I been trying to decide what display modes to support. That is beside the basic modes. ColorBurst sounded great, but I was disapointed in what I found. The ColorBurst idea is great, if only the program was better. Oh well. So far I plan to do the following:

640 X 400 monochrome (Not at first - not too pretty either)
640 X 200 4 color (Very limited but better than monochrome)
320 X 200 16 color (Reasonalbe for simple cartoon style amination)
Spectrum mode (allows some shading and a great paint program)

In the most recent issue of Unix/World (January) in the product of the month section, Atari announced their new IDRIS Mega ST. It is a Mega St with 2meg of memory and 20meg hard disk. IDRIS is a UNIX lookalike.

The article also mentioned Atari's plans to introduce a 68030 machine running System V UNIX some time next year.

And now in case any body is wondering why Im posting this, I wanted to wrap this as sweetly as possible. Yes, Im the jerk that made that nasty posting a few days ago about Ataris.

I wanted to make a few points very clear, reaching as many readers of this group as possible. The same applies for the "other group".

For years now I have read usenet news. I have watched passively as some of the massive flame wars have gone by. I have learned a while back, why.

Part of the problem lies in the news software and system itself. There is a widely held misconception in that posting news to a cross posting results in your message appearing only in your news group.

Unfortunately this is not so. And postnews doesn't warn you.

The other problem is that when a war is in progress, people that normally only read news, get upset and start posting to these flames going back and forth. (Im now talking about inexperienced users that normally never post at all, except perhaps an occasional question) This increases the traffic in both groups, in addition to what is already being said in both groups.

More traffic and hateful postings since it appears to readers of a this group that the "other group" is just posting nasty stuff in this group. (When in reality, the "other group" thinks the same thing). More hate. More unproductive junk, reaches a peak and dies, sort of. Except a lingering feeling that the "other group" is composed of vicious rabid dogs.

Now on to cross postings. Great but, thanks to these lingering feelings the inevitable eventually reappears. Wars. Hate. Mudslinging.

So, in view of this, and my past experience, I would recommend extreme caution in cross posting to the "other group" unless you possess superhuman unbiased opinions. Keep it generic. There is no reason it can't work out, other than those stated above.

That's all I was trying to say. I know its a bit radical, but perhaps in some way, this will be the war to end all wars.

Perhaps something productive.

And on that note, I just want to say....

Merry Christmas, and a Joyous New Year!

Sincerely

Harald Milne

Hello North-Americans (seems to me you are the worldwide only Atari-Users),
I know of course that sitting in front of an ST makes you forget all that
640k-limited trash some ppl regard as "standard for industry". Anyway, it
is a fact that a few people still have to work with such machines and already
paid a lot of money for software they could have cheaper and better for an
MC68k based instrument, right?
Now my question (sigh...!):
Is there anyone out there who has heard about a HARDWARE emulator for MS-DOS?
Here in Germany we are observing an increasing number of ads from a company
called Beta-Systems for their product "supercharger". Ich *YOU* are one of
the happy few who have seen and tested it please write immediately to me or
the list or to whatever, but tell me, tell *US ALL* if it works end where
to phone in order to purchase one!!!!!!!

thanx in advance, every suggestion and hint greatly appreciated -
*** Wolf-Dieter Batz (L12@DHDURZ1.BITNET)

696. problem with ue3.9e on atari

Newsgroup: comp.sys.atari.st
Date: 1987-12-17 10:28:26 UTC
From: abi@dutinfd.UUCP
Message-ID: <713@dutinfd.UUCP>
Source record: 255596

Ue did compile without a complaining and it also works as expected, except
once in 5 to 10 times my machine goes dead and needs a reset. It is before
or after a file is read or written. I use ue from gulam, but it also happens
from the desktop or msh.
I have a harddisk and no idea what's wrong.
Anybody out there has similar problems or no problems at all?
I recompiled the original version, because I changed the input to allow
the keypad to be used as function keys(I use my atari as a vt100 on UNIX
and that ue allows the keypad as function keys), but the problem is the same
with the original version.
HELP please

Well, watching a (known) video buffer allows you to magically bring the screen back to life when you get new output from the computer, as well as when you press a key. I can see that whether this extra 'feature' is useful or desirable depends on how you use the machine, and for what. Still, it *is* an extra capability that simply sitting on the palette and watching for keypresses won't cover.

Well, I've got two theories. In my more cynical moods, I envision ST's being churned out not by an Atari plant, but by a general purpose Taiwanese 'electronics construction plant' (there are such, don't know if Atari use them). So, this week they crank out N thousand ST's; next week, N thousand Amiga's; the week after than, N thousand IBM PC's, or a million pop-up toasters, or ...

More realistically (from my days of working for a company which actually made things you could see and touch), the electronics industry is not as 'unitized' as, for example, the auto industry (sheets of steel in one end, cars out the other). Even if you make the product in your own plants, you buy in a *lot* of the components, which (of course) you buy in batches because it's a *lot* cheaper. So, you've got to get a new batch of PC boards from your PC fabricator (almost certainly, while you design the boards in house, you have them made from your artwork outside); you've got to buy a new batch of cases from the plastic injection molding company; you've got to buy a new batch of custom chips from your silicon fabricator; you've got to buy in a new lot of monitors with your badge from your monitor supplier; and so on... There is the conflict between wanting to get large lots (lower unit cost); and wanting to keep the lots small (so you don't end up with 10000 Rev A ST boards when you suddenly discover you've got to make a mod to Rev B -- or worse, when the product stops selling).

This all forces you into a 'batch mode' style of operation, even if your final assembly plant is nominally 'continuous stream'. You can't just say, on the spur of the moment, 'gosh, think I'll put on a second shift and make twice as many'. You've also got to crank up all your suppliers. And you've got to be SURE you can use what you've ordered from them.

The manufacturing plant may be having quality control problems. No doubt that cranking up the production rate makes any such problems worse.

The suggestions given are pretty good, but I would like to add that you
should estimate the cost of buying the software you'll need, and factor
that into the costs when comparing PCs. Also try and take into consideration
the quality of the software as well.

My 6-year-old likes Little Computer People by Activison. The screen shows a picture of a house with a little man and a dog who walk around and do everyday things like eat, sleep, take a bath, play the piano, etc. The interactive part is that you can type in commands like "Play a game" (He plays 5 different games with the user, like Anagrams, Blackjack, and 3 others), "brush your teeth", "play the piano", "feed the dog", etc. If you ask him to type a letter, he sits down at the typewriter, and writes a personal letter to the user, like "Dear Josh, I am not thirsty anymore since you filled the water jug. Signed, Bill". The kids sit for (it seems like) hours just watching what he will do next.

I am suprised that no one has cited the "Little Boy Suite" on this topic. I cannot remember the composer's name, although I seem to recall that he was French. This was one of the works composed with Max Mathews' Music V system; and, as I recall, it goes down, rather than up. Nevertheless, the principle is applicable in either direction.

The composition was based on a timbre whose Fourier spectrum was periodic. Thus, it could be extrapolated both above and below the limits of human hearing. One could then gradually lower the fundamental, creating the sense of a descending pitch. However, new partials would enter from above as others would drop off below; and the effect was one of an endlessly descending tone. (The dramatic effect was intended to be that of the dropping of the "Little Boy" atomic bomb.) I have heard this referred to as the "fencepost" effect, because it is like driving past a long row of fenceposts with new ones always entering the visual field and no end in sight.

In appendix A of me3.9 reference manual, it is stated that "-A" flag
on command line causes emacs to load startup file "error.cmd".

Is this file available now?

I think it can be very useful for Mark Williams C users (I am one of them).

By the way me3.9 runs fine on Atari ST under MSH.

Thanks.

I tried this program, and I think I like, except that
I can not seem to get the screen saver to turn the screen OFF.

Has anyone figured out how to avoid the "reverse video" ?

My thought is that even with reverse video, the electron gun is
still on and burning some phospor. I want the screen to go black.

Rodney Peck's description of the audio haircut sounds like an old-fashioned "binaural" recording, which has nothing whatever to do with "holograms". Binaural recordings which you listened to with headphones were in vogue in the 1950s, before "stereo" with loudspeakers took over. Such recordings do indeed sound impressive, especially if the original was done with a dummy head, complete with realistic ears, and the microphones mounted inside the ears just where the transducer in a human ear is mounted. In that case, the phase-versus-frequency-versus-location function of the recording closely matches that of the live sound, so the brain evidently can dig the location information out surprisingly accurately. Someone once told me about some experiments in which this was carried a step further--the playback transducers were somehow installed inside the listener's ears so that there was no additional phase shift due to the path from the transducer to the eardrum. They said the sound was so real it was indistinguishable from hearing the live sound.

Nowadays the same result could probably be done with a digital computer to compute the inverse function of the path from a normal headphone driver to the inner ear. The fake head would still probably be the cheapest way to compute the function at the recording microphones.

From: schell@iris
Message-ID: <739@ucdavis.ucdavis.edu>
Source record: 255507

Maybe I'm just slow, but has anybody been able to get EZ Draw
(same as Easy Draw ?) to properly read .GEM files produced by Uniterm
1.7b ? I'd like to generate Tektronix graphics on the VAXen on campus
(I can), view them at home using Uniterm (I can), and import the
graphics into EZ Draw for my own diabolical purposes (I can't). The
TEKTOGEM program included with Uniterm seems to generate approximately
the correct file, but the resulting .GEM file lacks some initialization
junk near the top and seems to use a different coordinate system than
EZDraw-generated .GEM files. (I compared the two .GEM files using
Disk Doctor, a raw disk sector examination program).

Help me to be enlightened, please.

It peeves me that an important advertised attribute of GDOS, its
portability, does not actually exist. Also, is it ever going to be
officially released to non-developers ? Arghhh...

Thank you very much in advance,

Stephan Schell

These paths still work, I think:

> Thanks for your help.

I have watched for your repost, and have not seen one, so please
forgive me for being so bold as to post for myself.

I have been using APL.68000 for some time now. My first experience
with it was on an early "Pixel" machine that runs some flavor of UN*X
and one uses "ordinary" APL terminals. Now, as you have seen,
there are ports of
APL.68000 to micros with bit-mapped screens, such as the Mac, the
Amiga, and the Atari ST. The APL is *E X C E L L E N T*. The code is
mature and sound ... I have been using release 6.xx on my home machine
for over a year now and have found NO BUGS in the APL code. There are
a few minor problems with the interface to the fancy features of the
micro, but I believe these problems will be solved. The price used to
be $395, and that was a bargain. It is now $99, and the company offers
a FREE run time license to developers. It claims to be, and I
believe it to be true, that it is the FASTEST APL available today on a
micro. Of course the reason for the speed is that it is all written in
assembly code. That does not help the company do ports to new
hardware, but when they do get it, it is really fast.
As to the memory capacity, it depends on what memory you have and
what accessories you run. I have a 1 Meg machine run several
accessories and APL.68000 gives me a 735 K workspace.

How does APL.68000 handle the composite (overstrike) characters? There is a
special keyboard mapping that allows you to get composites by pressing
an alternate key, (the equivalent of another shift key), to get these
things. That is no problem at all.

For this, APL.68000 uses the same mapping that most modern APLs use;
that is, the keyboard mapping used when a 327x is connected to APL2,
and keyboard mapping used by the most recent releases of WATCOM APL,
STSC APL*PLUS, or IPSA APL, all of which run on the IBM PC. However,

each of these last three requires either a character generator chip or some sort of graphics adapter card. You, on the other hand, (with your Mac, Amiga, or Atari) have a bit mapped screen, and can put up a glyph of any shape at all, without the necessity of investing in a character generator chip. Thus the product is all software. No extra hardware needed at all.

This has an added bonus for users of APL on mainframes. For years there has been a scarcity of APL terminals. That now ceases to be a problem, because APL.68000 for the Mac and the Amiga comes with a terminal emulator build in.

Well, there is my 2 cents worth. I have no connection with the company offers this APL, I just use it and I like it.

Message-ID: <1987Dec17.211840.8771@gpu.utcs.toronto.edu>
Source record: 255513

When I bought my 1040ST about a month and a half ago I was looking for
a full featured word-processor. I chose WordPerfect because it
came with an impressive range of features, which allow me do do useful
text processing at home. (I have been spoiled by typesetters, but I am
having to get used to the fact that I no longer have access to a laser
printer).

Anyway, WordPerfect it was. The features are great, with one major exception:
It plain doesn't work. I won't repeat the bugs, which are numerous.
I wrote to WordPerfect and received no reply. I did receive their latest
updates though without any accompanying explanaton. These are dated
10/28/87. Slightly better, but still many things don't work (some critical).

I have been in touch with J.B. Marketing, their Canadian representatives
who are aware of the problem. Unfortunately they are still working
on their database of registered users so that no one has been notified that
the software is buggy. By the way J.B. Marketing is not mentioned in any
of their literature. I met them at the Canadian Computer Show.

Basically it's CAVEAT EMPTOR. Buyer Beware!

I am still impressed with the list of features. I am holding out hoping
that WP will resolve them.

HOWEVER, I found the release of such premium priced software without even
a small amount of testing (I can only assume this since anyone working
with the package would be frustated with it for days on end - I was),
inexcusable!!! Besides that, leaving registered users in the dark
and not even informing them that the bugs are known to WP also pretty
low. I am extremely disappointed at WordPerfect's handling of the whole
affair, and I think they're reputation will suffer as a consequence.

New updates are supposed to be released around the middle of December,
i.e. real soon now.

SO, IF ANYONE IS CONSIDERING, PLEASE DON'T. WAIT A WHILE AND MAKE
SURE THAT THE SOFTWARE HAS STABALIZED.

If anyone needs more info, please don't hesitate to contact me.

714. Observations

Newsgroup: comp.sys.atari.st
Date: 1987-12-18 04:36:41 UTC
From: jpdres13@usl-pc.UUCP
Message-ID: <515@usl-pc.UUCP>
Source record: 255514

Just some observations that I was looking for comment on:

Concerning ST-Log:

I can only assume that ST-Log and Analog have bitten the big one.

The answering service no longer handles them, they office doesn't answer, or it is forever busy. This has been going on for over 3 three weeks now. I called the East Coast Sales Rep Company, and the recording said that if you are calling concerning Analog/ST-Log call the company itself. After that I called the West Coast office and the girl told me that there will be an official response to subscribers in 2 weeks or so. I asked if that meant a magazine, and she said that she did not know. Well since I have not had an issue since Sept., I guess I lose. They did have enough personnel on hand to cash my $28 check after a month though! When I called my bank to cancel, I was told that the check cleared the day before. If anyone knows anything more concerning Analog/ST-Log please let me know.

Also, now I need to know where to subscribe to a good ST Mag, could someone please recommend something that has some technical heft to it? I don't want a mag that just reviews last year's software. Reviews are very nice, but not enough to totally comprise a magazine. What about Atari Explorer, is this good? Some source code in it? Neil, anyone? Please include addresses or phone numbers to mags also. I would really appreciate info here.

Concerning Megamax C & Laser C ---> it's an upgraded Version !

Having just become the proud owner of Megamax C for Xmas, I recieved a flyer in the delivery box announcing "Laser C" from Megamax. It boasts "The Fastest C Language Available for Your ST! Compile and Link the Sieve Benchmark in only 5 seconds!"

Below was taken direct from flyer:

>Features:
> * RAM resident graphics shell
> * Absolute code production compiler (no more 32k limits)
> * Variable size Ram Cache
> * Full Featured Make

After reading the flyer I gave the Megamax office a call, and inquired as to upgrade policy. She told me since mine was just bought it would be free! She also told me that those who purchased in '87 can get it for just $10, and buyers before '87 cost is just $20! Well, that sells me on Megamax, I may be wrong, but I seem to remember that the MWC upgrade price was $80. That is a lot of moolah for a program that can be purchased for just $114 mail order.

Oh, and by the way, I paid only $139 for Megamax. Write me for details if you would like the mail order house.

Anyway, I just wanted everyone to know the new product announcement, as I believe that current Megamax owners will be pleased to hear about the upgrade policy. I know this sounded like a plug, but I just got a little overjoyed. 8-)

Concerning Assempro:

I called them the other day, and I was told that they do have an upgraded version (nothing spectacular, just bug fixes) that has been available for about 6 months or so. Free upgrade! No cost at all!

Concerning Atari SX212 modem:

A friend of mine brought me down to my local Atari dealer and purchased a 1040ST. As a last minute thought (we assumed mail order to be cheapest) he asked how much the modems were. The salesman showed us the Atari SX212 for $89. Wow! This is a great modem, packed with goodies too! It is a bell 212a compatible (So near to Hayes compatibility, I could not tell the difference and neither could ANY of the term programs we tried) and a much better buy than the infamous Avatex 1200 (not 1200hp) that I received for $89. Even has an 800-series-computer port on it as well as the standard RS-232 type port. Highly recommended, this is what "Power Without the Price" is all about.

715. Re: OPS5 for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1987-12-18 04:45:55 UTC
From: chabris@endor.harvard.edu
Message-ID: <3602@husc6.harvard.edu>
Source record: 255515

OPS5 runs on the ST in at least one, possibly two, forms. I have a Cambridge Lisp version that seems to work, that was given to me by John Fitch (the implementor of CL). It has accepted the Monkey-and-Bananas code and another production system. There is also a version of OPS5 ported to XLisp (yes!), but I haven't gotten it to run on the ST. It probably requires XLisp 2.0, which is not yet generally available, and even then may need some hacking. I'd be willing to send that to someone who could try to whip it into shape, since I don't have the time. Hope this helps.

716. BMS controller package

Newsgroup: comp.sys.atari.st
Date: 1987-12-18 06:02:06 UTC
From: engst@batcomputer.tn.cornell.edu
Message-ID: <3217@batcomputer.tn.cornell.edu>
Source record: 255516

Has anyone had any experience with BMS and the package they sell that allows one to use a cheap IBM-PC style drive to hook to an Atari ST? I'm interested but would like more details about the BMS hardware and the prices and the difficulty involved in hooking everything up (oh and what other hardware, power supply, case, etc is needed)? Thanks . . .
Adam

engst@tcgould.tn.cornell.edu

(the offer still stands - send me any information on disk drives of any type and I'll summarize to the net)

(my 1040 internal drive will read files, programs etc alright most of the time now, but often gives the "Drive A: not responding . . ." error when writing to the disk - needless to say I have write protected most of my important disks.)

> INET: haitex@pnet01.CTS.COM

Wade, I'm possibly enlightened, but certainly NOT a theory expert, but I have dabbled just (barely) enough in music theory to be able to give what I think is a correct explanation.

As you, uh, er, noted, so to speak, Western music is based upon a 12-tone system. Specifically, each "octave" is divided into twelve notes. An octave is defined as a range of pitches or frequencies such that the high end is twice the frequency of the low end. Now, most things about human sensory response have the property that it is per cent change, or relative change, that determines the perceived effect. I.e., things that appear to differ by the same amount usually turn out to have the same ratio, not the same arithmetic difference. (Mathematicians call this a "logarithmic" response because taking a logarithm is what turns equal ratio steps into equal difference steps.) Anyway, pitch perception follows this rule very well. Most listeners immediately recognize that two pitches one octave apart, i.e. having a 2:1 frequency ratio, are very similar in some audibly obvious way, though not quite identical. Carrying the "equal ratio" idea further, one can subdivide an octave into steps having equal ratios, and that is precisely what the "tempered diatonic scale" does. If you want a ratio such that multiplying something by this ratio, R, twelve times in succession gets you to precisely TWICE the original frequency, then, voila, you need to solve the equation

$$F1 \times R^{12} = F2.$$

where $F2 = 2\,F1$. Then $R = 2^{1/12}$, i.e. R must be the twelfth root of 2.

That's what the tempered diatonic scale does, it constructs a scale of 12 notes so that each is the twelfth root of two times the previous one. At this point, my knowledge starts to run out. Apparently this gives pitches that are acceptably accurate for most purposes as approximations to the true pitches in every key, partly because the 12th root of 2 is a fairly small ratio to begin with (about 1.059). (Obviously the 60th root of 2 would give an even better universal scale!) I conjecture that the "ideal" notes are subharmonics of higher octaves or something, i.e F1 time 4/3, 8/5, etc. and in general a power of 2 (higher octave) divided by a small odd integer which gives a result between 1 and 2 (to put it in the reference octave of interest). (I just thought that up fast, in an attempt to sound as though I know what I am talking about, but re-reading it after thinking through what follows, I suspect it is correct.)
.pg
The question is just how closely the ratio R lets us approximate these pitches. For example, 4/3 is 1.3333333... and 8/5 is 1.60000 whereas the steps we get from the twelfth root of 2 are 1.122462, 1.1892071, 1.259921, 1.3348399, 1.4142136, 1.4983071, 1.5874011, 1.6817928, 1.7817974, 1.8877486, and 2.0000000. We can see that 4/3 is very closely approximated, with an error of only 0.113%, 8/5 is only off by 0.79%, etc. I.e. if you tune your guitar for the "tempered" ratios, you should find that it sounds equally good (or bad) in all keys, but if you tune by ear, you will go for 1.3333333 and 1.600000 etc., and it will sound even better in the key you tuned for, but horrible when you move your reference point F1 somewhere else so that the 1.333333 and 1.600000 no longer fall in the right places.
.pg
I have fooled around with writing BASIC programs to make music, and the tempered scale makes it pretty easy - you just compute 2^(1/12) once, then fill up an array covering as many octaves as you like with pitches. From there it's just a matter of picking the pitches out of the array in some clever fashion. If you want to make chords, you need to make up some rules for skipping over dissonant pitches and picking out ones that will sound good together. The numbers above give the clue -- ones that are close to numbers of the form 2^N / M where M is odd (else you could reduce N a bit) and the fraction is between 1 and 2 tend to sound harmonious, thus the 1.33333 and 1.60000. Since I have heard of "thirds" and "fifths", and "sevenths" for that matter, I now conjecture that these are just magic ratios of the above noted form where M is 3, 5, 7, etc. Golly, I think we are ALL expert music theorists now!

I did a BASIC program on the Atari 800XL, which has a 4-voice sound generator (and by the way costs only about $70!) and got some very pleasant sounding "alleatoric" music with 4-part chords, using random numbers to make some whimsical choices of notes from the array. I found the best results came from a "random walk" for one main theme note, then some random choices of thirds, fifths, etc. from the array. After going through the above reasoning, I think a better way would be to just compute the 4/3, 8/5, etc on the spot, because it would probably sound more harmonious. Oh, by the way, you also need some correction logic to make the random walk head back toward the mid-range if it runs up against some extreme high or low pitch.

The 800XL BASIC program is available if anyone wants me to post it. I imagine you could port it, maybe less one voice, to the ST fairly easily.

Note that when producing pitches on your computer, you will have another source of error, which is the quantization of pitch that the computer imposes.

I hope this (a) answers your question, (b) is true, and (c) is of enough general interest that the barrage of bytes is not resented too much by the innocent bystanders.

-John

> BACKGROUND COMPILATION NEEDS LIBRARY DISK
> PLEASE INSERT LIBRARY DISK INTO DRIVE B
First off, if you are telling your machine 'make fred' then you
are not a typical user either. If you are using make then
you probably want multitasking.
Second off, i know a number of typical users of machines.
These are people who do not program and just want to use
their spreadsheets and appointment calendars and whatever. Once
the light goes on in their heads about TRUE multitasking (NOT
kludges like Switcher and 'carousels' and so on) they begin to
think of things that had not occurred to ME - the alleged expert.
Multitasking is natural to anyone who can walk and chew gum. Others need
not apply. Which is why both Big Blue and Mac are going to
emphasize multitasking in a very short time- like now. I don't know about
Atari, but i wouldn't be surprised if they fell into it too.
I seem to recall that a lot of people wanted (want?) OS/9
and/or Minix for the Atari- seems a natural to me.
Multitasking is the future of home machines. I just read
an article by a journalist who talked about
computers in 2007. Much of what he described the Amiga does now,
in particular a description of his home machine doing two things at once,
but since he was a PC-oid ... you fill in the blanks.
I just love journalists- especially when they write about computers.

Since I am a Manufacturing Engineer at a division of Hewlett Packard
that builds computer peripherals, maybe I can lend some insight.
There are several constraints that can potentially restrict your
production rate. Your comment of cranking up the line is valid, however
lead times on materials for the product can be anywhere from 3-9
months. This implies that advance planning is required.
Therefore, your response in this case is limited by the response of
your suppliers. On the other side of the coin, there has been no
mention of the highest capacity of the ST production line. Maybe it
already is maxxed out. In this case, duplication or enhancement of
the line is required. This can take anywhere from 6 months to years
to accomplish. A manufacturer of any product has to walk a very fine
line between overproduction(heavy inventory; high expenses) and
under production(opportunity costs). Predicting the market accurately
is probably one of the toughest jobs there is and very few do it well
all of the time.

This is incorrect. In a recient message on GEnie, someone from
Atari mentioned that FOLDRXXX -will- work correctly because the person
who wrote it included a special hook in the program that will identify
new versions of the ROMs. It will then go into the ROM and find a
special table put-there-by-Atari(!) just so that FOLDRXXX -will- be
able to run on the newer systems...

> and the difficulty involved in hooking everything up (oh and what other
> hardware, power supply, case, etc is needed)? Thanks . . .
> Adam
> engst@tcgould.tn.cornell.edu

I built my hard disk system this way because I already had most of the
parts. If you're going to buy everything from scratch, then the cost
may exceed that of the commercial hard disks. However, the home-built
type may be more flexible.

All the hard disks work like this: (this paragraph is open to correction
by more knowledgeable people!): the DMA output of the ST, known as ACSI,
feeds to an adapter board. This board converts the protocol to SCSI, a
standard disk interface protocol. The SCSI cable connects to the disk
controller. The Adaptec 4000-series controllers is usual. The
controller then connects to the disk. If you look inside the commercial
units, I think you will find this arrangement packed in there.

The disk drive can be almost any unit that uses the st406 or st512
interface. (Is that the right number? Anyway, same disks used by IBMs.)
You may be able to use a disk with an SCSI interface by omitting the
Adaptec controller, but I haven't seen it done.

By the way, the BMS adaptor board includes a battery operated clock,
and I haven't had to set the time since I put it together.

So, total parts are: ACSI cable from ST to adaptor, adaptor board
($140), 50-conductor SCSI cable to controller, controller board ($125?),
34- and 20-conductor cables to hard disk, disk ($300?), power supply
($50?), cabinet.

As mentioned in the posting, adaptor boards are available from Berkeley Microsystems. I have also seen the adaptors from the commercial drives available. Adaptec controllers are available from BMS and others. Power supplies and cables can usually be found locally.

By the way, the Adaptec controller will support 2 hard disks. They must be very similar, as there are some jumpers on the board which affect both drives. Just make sure your power supply has enough reserve if you plan to go this route.

My system started out as an outboard drive for IBM PC's. It included the Adaptec controller (possibly damaged), and an Ampex Pyxis 13 10-meg disk, and a blown power supply. I added a new supply, had the controller checked out by Adaptec, bought the BMS board, and voila. I have since upgraded to a Seagate ST238 20-meg drive, and I have enough space and power to add another. (That's what I meant about being more flexible.)

If seeing the insides of a computer makes you queasy, don't go this route. If you think you can plug things together, this may be for you.

Please send me pointers to and/or reviews of Common LISP systems
available for the Atari ST. Particular attention to details such as
compilers, debuggers, and development environments (incl. editors,
GEM/mouse/graphics interface, etc.) would be appreciated. I am
also interested in linking foreign routines (e.g. C), and possibly
in non-Common LISP systems, as well.

Something on the order of Allegro CL on the Mac, but for the ST,
would be really wonderful. Coral Software doesn't seem interested
in building it for anything other than the Mac, though.

BTW, you may not want to trust the return address in the headers
above. If it fails, try the one(s) in my signature below.

Again, please reply directly to me, and not to the entire net.

Cross-posting to the ST and Amiga groups produces those nice long flames, right?

>I'm well aware of what multi-tasking does and doesn't do for you. I use it
>all the time on the mini's and mainframes at work. Nice.

I strongly suspect you would like it on your home machine, if it was available to you. We will take as minimum configuration a 520 ST with one single-sided drive, and leave the Timex-Sinclairs w/tape drive out of this.

>But, I question its usefulness (and even desireability) on typical 'home
>computers' in a 'home' environment...
>...So, what's my problem? [On] one or two floppy [system]
>I have an image of telling my machine 'make fred', and then letting it get on

>
> BACKGROUND COMPILATION NEEDS LIBRARY DISK
> PLEASE INSERT LIBRARY DISK INTO DRIVE B
>and, a second or two after I do that:
> FOREGROUND PROCESS NEEDS AUTO-SAVE DISK
> PLEASE INSERT DISK INTO DRIVE B

First off, since you are comparing it to an Amiga, it would never ask for drive "B". More likely it would say "Insert library disk into any drive".

>Doesn't feel profitable somehow, and definitely
>full of space for making nasty mistakes in the disk swapping.

It you put in the wrong disk it asks for the right disk. Nothing nasty happens.

You seem to make the assumption that lots of disk swapping is needed to multitask. This just is not true. Don't be silly, you can put lots of useful programs on one disk. 880K is not all *that* tiny.

Second off, most everyone without a hard disk on the Amiga uses a dynamically auto-sizing ram disk that will even come back if that neato-o program you just compiled crashed the system. With my 2 drive floppy-based Multitasking system I don't ever need to swap during a development cycle.

The only system that has a chronic problem with disk swaps is a floppy based Macintosh.

Do I find multitasking useful on a floppy system? Yes.

>What I am questioning is TRUE
>multi-tasking. I've got no argument with 'carousels' of suspended programs,
>and no problem with resident background interrupt handlers, such as print
>spoolers.

One fantastic improvement is how clean things get. No kludges. It works with everything else because that is the way things are, the natural order of things. 'Carousels' are also incredibly ineffecient in terms of memory use... memory is one thing you indicated you did not have a surplus of.

>But, I question its usefulness (and even desireability) on typical 'home
^^^^^^^^^^^^^
>computers' in a 'home' environment...

Perhaphs you are confused as to the fact the multitasking is an OPTION. You don't need to take advantage of it. Or perhaphs you think that OPTIONS are too complex for real people to contemplate?

The US distributor for MicroAPL's APL.68000 is

Spencer Organization, Inc.
PO Box 248
Westwood, NJ 07675
(201) 666-6011

I just got mine the other day. Watch it though, they tag on 4% for using a credit card and I don't believe they told me about it when I ordered. They used to sell for a coupla bucks (a give-away at APL-87 in Dallas this past spring/summer) a demo disk which was pretty much the same as the distribution disk sans workspace/function saving to disk.

MicroAPL is a company located in the heart of London, England. APL.68000 is version level 6 and thus is quite stable. An APL2 is in the works according to Bill Spencer.

I'm just re-learning APL on my Amiga but I'd sure like to hear from others and their experiences.

Happy Holidays folks!

730. Publ. Partner 1.03, help needed

Newsgroup: comp.sys.atari.st
Date: 1987-12-19 13:55:51 UTC
From: silvert@dalcs.UUCP
Message-ID: <2748@dalcs.UUCP>
Source record: 255530

I've just received my 1.03 update of Publishing Partner -- two disks, no documentation. The monochrome disk is defective and a couple of files are unreadable, including TOOLBOXM, which is essential. Since the colour version has been modified, I assume that this has too. If someone can send it to me (encoded) I would be most grateful.

I am still trying to figure out what they have changed -- I am running with the 1.02 TOOLBOXM file and everything looks identical. Even though they have changed their address (the new one appears in the README.DOC file), the old one appears on the initilaization logo.

Finally, does anyone have a PD Courier font with correct (equal) widths? I have an old font which Don Rice has told me how to fix, but before I spend an hour or two in the font editor I thought I would ask if anyone has already done it and produced a workable Courier for the LaserWriter.

>disk before saving the massive changes you just made to your novel...

Gee.. I used to do this kind of stuff on my cbm-64. 8-)
Bobsterm-Pro... great program.
As for the backups, I had a dual drive to do them with at one time.

>Or run a terminal program and a word processor at the same time,
>and produce well formatted answers as you read a BBS.

Again, bobeterm-pro had a pretty decent editor in it, not real good, but
plenty of power for writing messages.

>I'm biased, though. No way would I want to go back to a single tasking
>computer for anything.

A friend of mine said (as justification for buying his computer) that a
computer is like a microwave or a VCR. You don't know if you'll even use it
until you get it; and once you have it, you don't know how you got along
without it. Multitasking OS's are no exception. (I haven't turned on my c64
ever since I got used to the computer at work.)

I think, however, that the first time home (or other) computer user will not
realize or utilize the full potential of Multitasking for quite a while. They
will have enough fun just making the computer do things one at a time.

I'm in the process of deciding which hard disk to get, and would
appreciate if anyone with experience could respond to this. I have in
mind the Supra 20 Meg (i only have enough $$ for a 20 Meg) but I heard
that there are two different versions of the Supra 20 Meg, a 3.5" and
a 5.25" one. What are the differences? Also how does the access time of
the Supra 20Meg compare with that of the Atari SH204 (that big monster)? What
about repairs? I heard it's easier to get repair service for the SH204.

In the latest "Compute! Atari ST" magazine, Supra has an ad on the
back cover which show their 10Meg Floppy Drive. Looks real nice and boasts
an average access time of 85 ms.

Once upon a time there was some discussion in this area about MINIX being ported to ST. Has it yet.

MINIX is a UNIX lookalike developed for use in University operating systems classes. It is currently available for IBM PC/XT/AT type machines. The source code comes with the package. It is available for around $110.00 including manual from Prentice-Hall.

I think the ST could really use a low cost multi-tasking system as the commercially available products are much more costly.

Anyway has anyone have any recent news of MINIX for the ST.

Any two Geesh, How about two editors ? How about five editors ? How
about An editor and a c compile ? How about a modem program and a compile and
an editor ? etc. etc. etc.

>(And, maybe I'll feel differently if I ever manage to save enough pennies
>to buy a hard disk -- or, maybe even a couple of Meg of RAMDISK would do.)

Well thats just it isn't it ? The less resources you have, the more you
have to know what you are doing to extract the most utility from them.

I leave you to draw your own conclusion.

Details on request.

unless I'm sadly mistaken (and often I am) the BMS board set allows you
hook up any ST506 or ST224 (also mistakenly called SCSI) style disks to
the ST. The board set will work with disks with or without builtin SCSI
controllers. I presently use a single 64Mbyte disk with my BMS board set
but in the past I have hooked up 2 drives to the same board set and it worked
with no problems

With compile / link times like that, I assume the editor does tokenizing
like MAC/65 did on the 8-bits?? If that is so, the editor had better be
pretty good (GEM is still a little slow for me -- I do not have a blitter!)
and customizable (I use EMACS on our Suns and MicroEmacs on the STs...
I probably will not use anything else). The flyer (or at least the excerpt
says nothing about its libraries... I use MWC 2.0 because of its libraries...
Version 7 compatible. Makes it fairly easy to port real applications to the
ST line.

Of course, if Laser C _does_ fit my requirements, somebody please mail me!
I'd be the first on my block to have it!!!!

Body handling: Inline uuencoded payload not displayed: coldboot.tos

[]

A utility was posted a while ago to make the RESET button do a COLD reset.
I don't like that (since I want to keep the reset-proof RAMdisk) but
occasionally I do need a cold boot. Since HDB2.3 apparently does not
boot right if I leave the HD on and turn the ST off and on, I wrote the
following little ditty. It asks for confirmation, then does a cold
reset (that redoes the memory size check, although it keeps the time...).

- Moshe Braner

740. Spectrum style displays

Newsgroup: comp.sys.atari.st
Date: 1987-12-20 03:12:15 UTC
From: wayneck@tekig5.TEK.COM
Message-ID: <2264@tekig5.TEK.COM>
Source record: 255541

A couple weeks ago I posted a message stating that one could get more colors on the ST by page flipping between two screens with the colors set to slightly different values. Well after many trails and tests I've decided that that just doesn't work very well. No matter how careful one it you still get some flickering. Not only that but the color mixing is not very linear, so some of the inbetween shades aren't very inbetween. Anyway I decided not to waste my time on that any more.

This means I have to eat some of my words about ColorBurst since I can't do any better with the color mixing. Still I don't like that program. What I do like is Spectrum. Wow is all I can say. I never realized what could be done with only 512 colors.

So now I'm wondering if anyone else if planning to use the Spectrum style display mode. Seems some routines could be put together that would allow programs to make Spectrum style pictures. I believe that Antic and the authors of Spectrum don't have any rights to those type of displays as long as their code isn't used. Are more people planning to do this type of thing?

By the way, I tip my hat to Antic and the Spectrum 512 authors. What a fine program.

Wayne Knapp

741. Looking for owners of following color printers:

There is an RS-232 standard. You can get it from (I think) the American National Standards Institute. I've got a copy somewhere around here myself. In that standard, everything having to do with an RS-232 interface is defined, carefully, from the rise times of the signals to their meaning to the pins and connectors they are supposed to go to. If you've got to wring anyone's neck, wring that of the 95% of the manufacturers who decided that truly following the standard was too much of a pain in the neck, so went off in their own direction, leaving us poor users to try and patch up the differences.

1) Buy some RAM

2) Place your needed libraries and such in your
new RAM.

3) Multi-task without errors.

4) Write programs which use multi-tasking to
simplifiy design.

5) Remember, what the few want today, the masses
can't live without tomarrow!

746. Re: Laser C (Megamax 2.0)

Newsgroup: comp.sys.atari.st
Date: 1987-12-20 16:00:15 UTC
From: braner@batcomputer.tn.cornell.edu
Message-ID: <3221@batcomputer.tn.cornell.edu>
Source record: 255548

[]

I have just sent away for the Laser C upgrade, and will post when I get it.
But don't worry, Greg. 5 seconds for compile+link of a SMALL program is
certainly feasible WITHOUT tokenizing the source code. The current Megamax
compiler (not linker) reads a text file off the RAMdisk and compiles it
in about 2 seconds _once_the_compiler_is_launched_. The recent Megamax
flyer says something about their new (graphical) shell keeping multiple
programs (e.g., editor, compiler and linker) RESIDENT in RAM (not filed
in a RAMdisk), presumably saving a couple of seconds on the launching of each.

- Moshe Braner

PS: For those of you that had problems uudecoding IDLE:
Remove the 'z' at the end of each line.
(Sorry for that. Source was sent to Turner)

PPS (literally): speaking about tokenizing, couldn't the Postscript page-
description language, which is known for its slowness, be substantially
speeded up through tokenizing? That would also save on the communication
time (length of text sent to the printer) and disk space (if saved as
Postscript). Printing an (Atari ST mono screen) bitmap on an Apple
Laserwriter (via 9600-baud serial line) takes a couple of minutes, and the
recent Cricket Draw for the Mac saves a typical graph on the disk as a
50-100K file!

PPPS: When, oh when, will we have compiler support for writing GEM metafiles,
and a GEM-->Postscript translator? (Anybody looking for a project? :-)

Of course, you don't need multi-tasking to do either of the above jobs.
A desk acessory does quite nicely (whether you're using an ST, Macintosh,
PC or Amiga).

The "average user" would be satisfied with a desk accessory, while the
"power user" will want multi-tasking. The "power user" will ALWAYS want
as much as possible in the machine being used. (Which is why I think
the "power user" should own a Sun or Apollo or VAX workstation and
forget the piddling PC market).

Now, for the "Why I don't want a multi-tasking system". (Of course, I have
access to HUGE multi-user, multi-tasking systems at work...)

I find that I get to do many little things around the house while I'm in
a terminal session. I can catch up on my reading, prepare dinner, change
record albums, everything except un-ARC files I'm downloading (which is
about the only thing I'd do if I owned a multi-tasking system).

If I absolutely have to locate a file, I use the capabilities of my terminal
program's file selector to locate the thing and then go on doing whatever
I have to do. Of course, I can also use the CLI desk accessory that I have
up and running, too.

Face it, most of us are (for the most part) linear beings. For single, home systems multi-tasking is a less than useful for what we bought a computer for ... writing information down, filing that information, retrieving the information and playing games. :-)

-- Dave Meile

(yes, I know I'm cross-posting this ... some of my best friends own Amigas, Macintoshes, IBM machines and Atari STs. They are all less powerful than the VAXstation 2000 sitting on my desk at work.)

> Except of course, the classic FORMAT a diskette while the terminal
> program is downloading the file to the ramdisk, or make a backup
> disk before saving the massive changes you just made to your novel...

I think that these arguments aren't representative of an *average* user,
since an average user is more likely not to own a modem. Making a backup
of a disk before saving changes isn't multitasking. It's context (or
process) switching. In my opinion, context switching is a good thing for
the average user. Why add the overhead of a multitasking system when an
average user probably needs only context switching?

> Or run a terminal program and a word processor at the same time,
> and produce well formatted answers as you read a BBS.

Reading messages and generating replies in a word processor is again a case
of context switching. But then the average user doesn't call a BBS,
either. Multitasking would allow reading of the messages, then the user
could download a file while generating replies to the already read
messages.

> I'm biased, though. No way would I want to go back to a single tasking
> computer for anything.

Neither would I. Well, I do. But I don't think you are an average user,
and I don't consider myself one. I think multitasking is a great tool for
us hackers, though.

750. about ST disk drives.....

Newsgroup: comp.sys.atari.st
Date: 1987-12-20 23:38:00 UTC
From: gjwelych@SUNRISE.ACS.SYR.EDU
Message-ID: <8712211937.AA01474@ucbvax.Berkeley.EDU>
Source record: 255452

Hi all....

I have had one of my disk drives die on me, and rather than try to get
it fixed, (it was only a single sided drive anyways) I decided to
buy a cheap(er?) double sided drive. I hooked the new drive into
the little converter card inside an Atari drive, and connected
the power supply up. It works fine except for one slight problem
which can cause MAJOR problems with certain software.
The problem is this:
Say I boot up with disk A in drive A, and disk B in drive B.
(drive B is the new drive)
Then after I get the desktop, I change drive B's disk to disk C.
(I have a window automatically opened for drive B on the desktop)
Then I hit ESC to get the new directory, but it doesn't know
I changed the disk. I am assuming that the disk drive has not reported
media change to the ST so it doen't think that there might have been
a switch.

Now to my main question:
What in the Atari drives senses the change of media??????????!!????
And how does the drive signal this to the ST?????

Thanks in advance for any help,

Greg Welych.

And of course there is the "My wife will beat me if I don't do so-and-so at 6:00 pm so I'd better put up my alarm clock program in the background while I play this game/write this paper."

I have a friend who was one of the (if not THE) very first Amiga owner in Louisville who had a very legitimate m/t usage:
1. Running a word processor to modify a program he was writing.
2. Running Lattice to compile the code.
3. Running a previous version of the code to find deeply hidden bugs.
4. Running a terminal program to occasionally chat with his friends who were using a local system's version of forum (like CB Simulator).

Sounds like a very productive use of one's time to me. I can't stand to use some of the other "home" computers from time to time that don't even have keyboard type-ahead, muchless multitasking ability.

Source record: 255454

Hi all...
Can anyone give me an exact date of when Microsoft Write is supposed to appear. Should I hold my breath ? The reason I'm asking is that I need a powerful word processor that is compatible with either an ibm or mac system. Wordperfect isn't perfect and I've seen numerous beta versions of Write floating around for at least 2 years now - so should I break down, buy a magic sac and run word 3.01 (and spend hours getting it transferred to mac format for printing) or wait for Write and zap it to a PC formatted 3.5 inch disk for laser printing. (yes, I've seen wordwriter, 1st word plus etc.. but I wouldn't want to do too much with these programs)
Is anyone at atari/microsoft listening ??

/Leonard

754. TOS bug ?

Newsgroup: comp.sys.atari.st

[line to be eaten...]

I have run into some problems as i tried to copy files to a Harddisk.
I had 2 SH205-Harddisks connected to my Mega ST4 and tried to copy a (german)
TeX-Distribution from one Harddisk to the other. The fonts are located in a
couple of subdirectories all named 'PXLnnnn', where 'nnnn' stands for a four
digit number. I tried to copy the directories by opening two windows,
selecting 4 directories and pulling them in the other window. For the first
2 or 3 directories all works well, but then suddenly the name of one of the
directories will change! The 'X' of 'PXLnnnn' will turn in the Sqare-Root-
Symbol or in a superscript '3'.

I had *no* accessories installed, there was no folder-limit (4 meg is enough
to run FOLDER999.PRG to get 999 extra folder slots...). The second controller
was switched to unit 1, so there were no hardware interferences.
If i copy the whole thing from floppies to harddisk, this problem never occurs.

I remember hearing something about a bug in TOS relating to this problem
a long time ago. Can anyone give me some further help or a workaround ?

An example of the value of Multi-tasking:

It took me 4 tries to log on to the local network
I use to access UseNet. In beteen attempts I was
alternating between periods of work on a program I am
writing and a document which goes with it.
I am running Benchmark Modula-2's EMACs editor, and
it is loaded with 9 different buffered files. I am also
running "ProWrite" which is loaded with my document
files (only 1 right now). And of course, I am running
Diga, which is the terminal package I am using to connect
to the net with.

Were I to be denied Multi-tasking, I would be facing re-
loading all the files which are sitting in memory right
now! It would be nice to use a WP to create responses to
the postings, unfortunatly the local net would log me off
too quickly.

I have a multi-tasking machine on my desk too! It's called
an "Amiga". Why complain. I figure Muti-Tasking with the
Amiga vs. no Multi-Tasking with the Atari-ST is like whether
or not to accept a raise from your boss vs. turning it down.

Merry Christmas,

Wade.

I am considering making a program I have written work in
conjunction with a fellow Amiga programmer's program. He is
a JForth programmer and I use Modula-2. But we think we can
run as seperate tasks and use the message port system for
communications. Through these ports we can exchange real
data such as screen pointers or ???

How do you do this without multi-tasking?

Sure, It could be done, but multi-tasking makes it easy, elegante,
even even somewhat standard.

I tried to cut out alot.. probably should have cut out more :-)
WHAT IS AN AVERAGE USER ??????? A GAMER ??? A PROGRAMMER???? A PERSON
WHO USES THIER COMPUTER FOR BUSINESS REASONS??? AVERGE TO WHO ??????
in another posting someone said average users don't call bbs's,
and dont own modems.. SORRY.. why are there more BBS's now than ever, more
"POWER" users no... more "average" people with more computers....
>
>The "average user" would be satisfied with a desk accessory, while the
>"power user" will want multi-tasking. The "power user" will ALWAYS want
>as much as possible in the machine being used. (Which is why I think
>the "power user" should own a Sun or Apollo or VAX workstation and
>forget the piddling PC market).
Do you also feel anyone who wants to drive fast should own a
ferrari or lambroghini ????? even if they can't afford it??? but instead
maybe just put high test gas in the old chevy chevette ??????

I FEEL ONE QUOTE SAYS IT ALL.....
"The most important concept in modern operating systems is undoubtably
multiprogramming. By having a number of programs in memory at the same
time, the cpu may be shared among them. This scheme improves the overall
efficiency of the computer system by getting more work done in less time "
---from Operating System Concepts, Peterson and Silberschatz
for more, read chapter 4 of the above book....

When we had older computers, we always wanted more power, and more
cpu cycles to get our work done faster. Now we have greater speed, speed
that very often gets wasted because of I/O, and waiting for user
input, and so on. With multitasking, the cpu is used more efficiently, and
we can of course get more work done. Period.
If I want I can constantly have a CPU intensive ray tracing program
running, when I want my editor to run, and keep the ray tracing going, but

give more cycles to the editor, I can do it, as easy as I just said it, then
when my editing is done, go back and raise the priority on the ray tracer. if
I couldn't do this, when my ray tracer was working, I might as well forget about
my machine, and not use it for 12 to 40 hours as it completes the picture.

Dave, While making dinner, lets say a steak, baked potatoe, corn, salad,
and lima beans (YUCK :-( ). Do you cook the steak, then eat it, and cook the
corn, and then eat it, then cook the potatoe, then eat it,then make the salad
and eat it, etc. ect. etc..... ????? NO, You Cook everything at once, except of
course the salad, I hate cooked salad :-), and then eat everything at once...
That is NOT linear, humans are DEFINITELY not linear.
The classic about walking and chewing gum, is a perfect example.... :-)
>

i too have been hearing rumors about analog and st log ever since
the summer. in late october the washington area atari fest was held
nearby, and i attended. i was surprised to see a booth set up by
st log, manned by one guy. i asked him the obvious question about the
rumors of his (st log's) death being premature or not. he vehemently
denied any business problems, instead citing the changing of printing
companies mid-summer for their production problems (funny, i would have
thought you would change printers to *fix* production problems...)

if in fact analog/stlog has been going down the tubes since summer,
i feel quite strongly that the placement of a salesperson soliciting
subscriptions at a show (in late oct., mind you), with no realistic
likelihood of ever delivering on them, is probably no less
criminal in nature than a mail-order florida real-estate scam.
shame on them!

i get a little p/o'd when someone lies to me so directly.
i too got taken for the $28. oh well, if i'm lucky they'll probably
compensate me with a subscription to an apple // magazine, or
cosmo or some crap.

inqiring minds want to know....

the release of magic sac software which comes with the translator one shipped this month is version 5.5. it includes a number of gemdos utilities, including MOVER.PRG, which moves files between gemdos format floppies and either mac format or magic format, and vice-versa. since this is a gemdos application, you don't need a magic sac cartridge to do the transfer (though of course you do need a translator one). the documentation makes it clear that the usefulness of a mac file in the gemdos environment may be pretty limited, but i suppose you already knew that.

allow me to offer my assistance (warning, rampant capitalism follows). if you are interested i would be happy to act as a service bureau for you. mail me your mac floppies and a corresponding number of blanks, and i will perform the xfer for $1 per floppy, plus return postage (cheap at twice the price). seriously, if i can help you out, give me a call.

Oh, whoops! I didn't really mean that! I was trying to imply that
RS-232 is more of a general protocol that you'd want on a computer,
where MIDI is specialized so that it can only be used for music. If
you had a computer with only MIDI ports, you wouldn't be able to easily
connect to a variety of generic hardware devices like printers and
digitizers, to name a few. You are right that MIDI is a little more
defined that RS-232.

I can't believe this discussion. Here we are, all us good hacker types, arguing that Joe Average is Too Limited, The Poor Soul, to really Appreciate the Beauty of Multi-Tasking (*cue Heavenly Choir*)

You would be surprised what Joe Average can do. He is pretty smart. I have seen this any number of times: once the light goes on in Mr. Average's head, he (and she, of course) will never want to give multi-tasking up.
The 'oh but desk accessories are ok' is a specious argument. Desk accessories are a kludge-o form of multi-tasking. If you want to argue that Desk Accessories are a good thing, then you are arguing FOR multi-tasking.

If those are the same ROMs that they are selling us developers, then the
answer is NO, the "40 folder bug" still exists, and the magazine article
is incorrect.

Neil: please jump in here if if the ROM upgrade for the 520/1040 is different
than what is in the Megas. I understand they are the same.

Ahem. In case you haven't noticed, the "masses" are NOT buying microcomputers. They certainly aren't going to "need" multi-tasking systems, and would probably be able to live without them (or computers, in general) quite nicely thank you very much.

Computer chauvenism. People will go to great lengths to "prove" that a feature of the operating system or hardware is what makes a particular system better. Of course, we all have a vested interest in that "proof" -- we just don't want to believe that we bought an "outdated" computer. Hah!

People want computers (when they want them at all) to DO SOMETHING for them. In the majority of cases with the Atari ST and the Amiga, that "something" has been:

writing stuff
filing stuff
retrieving stuff that's been filed
playing games
programming all of the above

Most of those who read these forums fall under the "programming" category. Of course, for programmers, multitasking can be a delight. For the person who is writing a term paper on the microcomputer, why bother? If you have access to two programs (ala Multifinder or perhaps through a "desk accessory" [IBM PCs have desk accessories too, folks]) you already have as much power as you're ever liable to need in most environments.

It's totally "neat" to download a file and play chess at the same time. But I've never come across a time when it was necessary to do so. So, let's get off this kick about multitasking being a "necessity" in a computing environment.

This reminds me of a cute article I saw recently. The author was
complaining about speedup boards on his IBM. No longer could he have
dinner while a program compiled - barely time for a cup of coffee.
But for some of us, multitasking helps rather than hinders the
enjoyment of life. I do most of my compiling at the office - can't make
dinner there, or play records. But with multitasking I can listen to the
Amiga's music (DMCS) while I compile or, best of all, read the net :-).
Or both.
You see? Your mistake is using multitasking to get more work
done!

Here we go again...

THE 40-FOLDER BUG IS NOT FIXED. THE 40-FOLDER BUG IS NOT FIXED.

Use FOLDRXXX.PRG (rename it to FOLDR100.PRG and put it in your AUTO folder)
to work around this bug. You will not be notified when you run out of
folders, but it's a lot harder to use 140 than to use 40, and if you
do get close to that, just rename it to FOLDR200.PRG.

I WILL TELL YOU WHEN THE 40-FOLDER BUG IS FIXED. DO NOT BELIEVE ANY
OTHER REPORTS UNTIL YOU HEAR IT FROM ME. I AM THE ONLY PERSON WORKING
ON THIS.

I *am* working on it, so don't despair. When the fix comes out, it will
be more sweeping than you think (unless you think big).

I am interested in a GO BOARD program which runs on
the Atari ST computers. My primary interest is recording,
saving, and printing game diagrams. Can anyone recommend
such a program, either commercial or public domain?

I have downloaded a public domain program from the Atari
BBS which has some of the features that I'm looking for. Its
major shortcoming is that it does not place numbers on the
moves in the diagram, so you can't really use it to make a playable
game diagram.

Thanks for your help,

Jonathan Nagy

Check out the adjustments inside your monitor (use great caution, there's
high voltage there). The vertical hold is probably a hair off. The demo
pushes the system harder than most applications, and even a touch off will
clobber you.

771. Abaq

Newsgroup: comp.sys.atari.st
Date: 1987-12-21 20:43:06 UTC
From: neil@atari.UUCP
Message-ID: <912@atari.UUCP>
Source record: 255471

Here is some information on the forthcoming Abaq system, straight from its developers at Perihelion:

THE ABAQ

written by Perihelion, Ltd.

Hardware Specification

The base machine outline specification is as follows:

T800-20 Transputer 10MIPS, 1.5 Mflop
Three 20Mhz links, buffered
4Mbyte DRAM
1 Mbyte dual-port video RAM
Colour blitter
True DMA SCSI port for 40M (minimum) hard disc
Three internal expansion slots
68000 Mega ST as I/O processor (plug in card connects fourth 20Mhz link)

Screen Resolution and Use

The table below lists the screen resolutions and their probable typical use. All the following are at 60Hz with portrait orientation.

Mode Resolution Width Description

0 1280 x 960 4 bits/pixel 4 bits/colour or monochrome
(Desk Top Publishing, engineering drawings)
1 1024 x 768 8 bits/pixel 8 bits/colour
(CAD, colour pictures, graphs)
2 640 x 480 8 bits/pixel 8 bits/colour 2 screens
(Animation)
3 512 x 480 32 bits/pixel 24 bits colour, 1 overlay bit, 7 tag bits
(True colour, smooth shading, 3D modelling)

The Blitter

The Perihelion blitter is based on work done by Dr Phil Willis of the University of Bath. It provides meaningful operations with colour and colour look-up tables (CLUTs) and implements very fast 2-D raster graphics operations, such as fast font drawing. It also provides a 32-bit wide pipeline (with four tests on each of eight pixels concurrently), and is synchronised with blanking. Using the blitter, square area fill takes 128 megapixels per second, arbitrary two colour character drawing takes up to 64 megapixels per second, and full 2-D block copy takes 16 megapixels per second.

Expansion Capability

The Perihelion design provides for three expansion cards within the box. These can be memory cards, providing a maximum of 64Mbytes using 4M parts, or various versions of alternative graphics cards. The full transputer bus is brought out so any type of peripheral may be connected.

The expansion sockets also bring out the transputer links and control signals. This means that cards containing extra transputers can be added, and the size of the cards allows for four transputers with up to 1Mbyte of RAM each on a single card. One workstation can therefore contain 13 processors. Other link connections can be made outside the box to parallel processor farms of multiple processors. The link connections can also be made to fast peripherals such as a laser printer or disc server.

The Transputer

The T414 is a 32-bit processor that consists of a RISC style CPU, 2K of fast on-chip RAM, an external memory interface and four serial links which may run at 5, 10 or 20 Mbits/second. The T800 is similar except that it also contains a floating point processor and 4K of RAM.

The programmer's model consists of a three register evaluation stack, a workspace pointer and an instruction pointer. A small number of instructions exist for loading and storing values on the stack and for altering the flow of control, the remainder operate on operands on the stack.

The processor has microcoded support for processes at two priority levels. High priority processes may preempt low priority processes after any instruction and run until they give up the processor. High priority processes are essentially equivalent to interrupt routines on conventional processors. Low priority processes are round-robin scheduled on a timesliced basis. Timeslicing only occurs on particular instructions which are defined so that the minimum of state need be saved; process switching is therefore very fast.

The transputer achieves inter-process communication through channels, which are single words
of memory. Two processes that wish to communicate rendezvous at a channel and exchange data by copying from one buffer to another. As this is implemented by the microcode, the cost of copying lies only in the memory accesses for the data and not in instruction fetches. Communication is strictly one-to-one and channels may not be shared by more than one sender or receiver. The inter-processor links are designed to behave exactly like channels, and are used with the same instructions.

Parallel Programming

The unique aspect of the Atari/Perihelion design is that is provides multiple processors within a single workstation.
The use of multiple processors means that is is possible to write application programs which make use of the possible parallelism inherent in such systems.

Application programs can run under Helios using three programming philosophies. The first of these is the traditional programming model. A program can be taken

from another environment, such as Unix or a PC, and with little or no change converted to run under Helios. C and the Unix C library is provided, and such programs will run as a single process in the machine.

Other programs, again probably from Unix, will run in several sections all of which may be run in different processes and connected by pipes. Helios encourages the use of many small programs which work together to create a final product. A common example is a pre-processor, a compiler front end, a compiler back end, an assembler and a linker. These can all be run together with intermediate connections made by pipes. Under other operating systems the different processes are timesliced on the one single processor. Under Helios these different processes can be allocated to different processors, so that the individual parts actually run at the same time.

This type of "per-process" parallelism is easily understood, and many applications are already in this form. Examples include a word processor with background spooling and spelling checking or background jobs such as message systems or archiving. If an application is being altered then the use of extra processes should be kept in mind.

The final way in which parallelism may be exploited is by the use of parallel algorithms. These tend to be hard to find for programmers used to the sequential nature of normal computers, but a look at the real world shows, of course, everything running in parallel. Applications using parallel algorithms will normally be written from scratch with such ideas in mind. The benefit is that such programs will run much faster when the user provides more power in the form of more processors. Many examples of parallel algorithms exist, such as ray tracing, spreadsheet calculations, even compImplementation

Helios presents a low level interface that should be familiar to programmers who have worked on Unix. Each user runs a number of tasks which can communicate between themselves using a simple message passing protocol. A message may be transferred between two tasks in the same machine or between tasks in different processors; in each case the call is identical and the message is copied rather than passed by reference.

Each task is constructed from a number of interconnected transputer processes which can communicate either by message passing or by sharing data. Different tasks may be written in different languages as all communication at this level is by message passing.

The design of Helios is based on the client-server model, where application tasks request services from system provided server tasks. These server tasks may be present in any or all of the processors available, although each processor must run the bare minimum of the name server which identifies the location of other services. Other servers include file handlers, window managers, date servers, spoolers and so on. All servers respond to a general server protocol which is designed so that servers may be stateless and hence unaffected by crashes and communication losses. This mechanism allows a wide choice in the way in which servers are implemented; for example, floppy discs will be written using the MS-DOS format while winchester discs will use a format similar to Unix.

As noted above, the transputer does not contain any memory management unit
and none may be added externally. Helios assumes that each processor is
allocated to a single user, and protects processors by a capability mechanism.
An access matrix is used to implement a filing system control scheme.

System Tools

Helios is written in a mixture of transputer assembler and C. System tools
include a macro preprocessor, a C compiler, an assembler and a linker. In fact
these last two items are the same program as the transputer has a variable
length instruction set that requires a 'code growing' algorithm to ensure
optimal code lengths sequences. This must be performed in the linker once
all external references have been satisfied.

A debugger that allows one transputer to investigate another
will also be included in the package (although not in Version 1.0).
Third party software developers are providing Pascal, Fortran, Lisp and BCPL
as well as the traditional transputer language occam.

User Interface

The user interface consists of two parts: a command
line interface similar to the Unix C-shell which provides the usual
commands such as grep, ls, more, and so on; this will be coupled to an
implementation of Xwindows V11 to provide the now familiar windowing
mechanism.

The system will appear similar to a more conventional machine, except that when
the commands are piped together the operating system may make use of more than
one processor to run the commands concurrently rather than timesliced as
in a single processor environment.

The programmer's interface will be complemented by a 'point and push'graphical
interface for the less experienced user. This will use a mouse and pull-down
menus and will be implemented on top of Xwindows.

>of the Amigas and Ataris sold end up. What I am questioning is TRUE
>multi-tasking. I've got no argument with 'carousels' of suspended programs,

The TRUE benefit of TRUE multitasking in the home enviorment is made up of a large number of trivial advantages. I believe that I am much more like the average home user that the average participant of this net. So a few trivial examples.

I am writing a letter using my favorite editor. I want to refer to something that I wrote some time ago. I don't remember when I wrote it, if it was in a letter or something else. I don't remember much about the context. In other words somewhere in perhaps half a dozen 3.5in floppies is something I would like to copy into the letter I am currently writing. What do I do?

I take one of the half dozen disks, which I think may contain what I want to copy, stick in my my second drive, open a new window by using the pull down menu on my editor, start a search for some word that I might have used in the prior document, direct the search output to ram, click my editor to the front, and continue with my writing while the search process runs in the background. When the drive quits running I click its window to the front, print the search output to the screen. When I see a line that looks like it might be in the file I am looking for, I can open a new window and scroll through the file to check if it is what I want. If it is, I can open a new editor, clip the text that I want, click to my letter and paste the text in. Describing this process took far longer that doing it. But most important my train of thought doesn/t get interrupted while I search for the filed inormation.

Without multitasking I would either try to recreate the old text, change my letter so I wouldn't need the data from teh hidden file, or spend a lot of MY time looking for the file. This whole process takes but a few seconds of MY time and lets the COMPUTER spend a lot of its time between my key strokes finding my data.

The advantage of TRUE multitasking is that I can decide to have the computer do ANYTHING that I have any softwhere for, while I do something

completly different.

Another example suppose I am a real estate salesperson. I have a data base of properties available, I have some information about some prospective clients. I can do the same sort of search for properties while I am reading the information about the prospective clients.

Suppose I am composing a song, I want a phrase from a song filed somewhere on a disk, I sequence through stored songs on the left spesker while I continue with the composing.

I want to describe how a game works while I am sending a message to a BBS. I start up the game, without shutting down my connection to the BBS..

I am doing A...I need the results of Z... to add to A...

A can be anything that my machine can do. Z can be any thing my machine can do including another A or any combination of 2 ,3 ,4 ...n, process from A....Z.

Richard Foy

I have tme BMS controller. It works fine (once we found the bugs but
that was almost a year ago). The only question I have about it is does
it actually cost less. You need to buy the interface and controller
($250, I think), then get a drive, box and power supply.
No problems putting it together but when you are done you probably
could have bought a Supra or Atari drive.

I agree, it would be nice, but it's not right the right option. I wrote
a small C program that just prints its arguments, and called it me.prg
(the name Mark Williams gives to their uEmacs derivative) and put it in
my \bin directory. Then I ran the C compiler on a program with a
deliberate error so it would invoke my me.prg. Well, the option the
compiler used was -e, not -A. This would be an easy fix, but uEmacs
uses the -e option for something else. What I was thinking of was a
small program called me.prg which changes the -e to a -A and runs
emacs.prg. Then the file error.cmd would become useful. Anybody got
one yet?

No... The best response to this question is the old standby phrase:

"If it works, don't fix it."

If the chips are well seated, opening the case, pressing on them and
then replacing the case will, with time, tend to loosen them when there
was nothing wrong to begin with...

This whole discussion has generated a lot of heated arguments, mostly
from Amiga users who enjoy being able to multi-task, giving example
after example of how nice multitasking is.

However, practically EVERY argument given FOR multi-tasking can be
satisfied by the 'carousel' approach that the original poster acknowledged
were a good idea.

I'm still waiting to see if someone can come up with a use for TRUE
multitasking that a typical home user would find very handy but that
cannot be satisfied by a simple 'carousel' approach. There probably
are some, especially with message-passing, etc., but none have been
posted yet (except for people waiting for their compilers to finish --
they just need faster integrated compilers, though :)

> multi-tasking. I've got no argument with 'carousels' of suspended programs,
> and no problem with resident background interrupt handlers, such as print
> spoolers.

You're certainly correct in assuming that if you've got one task that needs
both drives to function, and you change a disk in one of them, that task
is likely to complain. All that requires is a bit of forethought.

However, in the very small system case, like maybe a floppy or two and 512K,
you'll still find that multitasking is very nice. For example, the OS on the
Amiga runs separate tasks to do lots of work for you. The mouse never slows
down much under heavy loads, as the mouse handler is running at a much higher
priority than most user tasks.

Another nice thing is that true multitasking eliminates the need for desk
accessories, and all the kludge that goes along with such items. On non-
multitasking machines, a desk accessory is a special kind of program (must
be specially written to be accessory, or worse, an IBM-style TSR program).
And in order to get this program from within a regular one, the programmer
of that regular program must call some LookForARequestForDeskAccessory()
function as often as possible. With real multitasking, there's no such thing
as a desk accessory; all programs are written the same way, and if memory
permits, you can call up WordPerfect or Emacs just as easily as NotePad to
jot down something during a compile or terminal session.

If you get into programming much, you'll also find that the ability to spawn
off subtasks is quite a nice thing to have around. Now, you're not going to
get very far on a 512K machine doing UNIX style fork()s all over the place,
but the lightweight task model you find in the Amiga OS is perfectly useful
in such a context.

Well, the "power user" will tell you to buy a ferrari if you want to race
other ferrari's. The old '57 chevy just won't cut it. However, if you want
to point at all the other '57 chevy cars and say "I can blow 'em out of
the water", fine. Just don't expect the other '57 chevy owners to agree
that it's necessary.

>---from Operating System Concepts, Peterson and Silberschatz
> for more, read chapter 4 of the above book....

This quote is for the "power user". I'm absolutely certain that Peterson
and Silberschatz weren't considering mocrocomputers when they wrote that
book. Of course, if we followed the computer science model for home
computers, we'd all be programming in ADA or Modula-2, and have degrees
in math to boot. :-)

>and eat it, etc. ect. etc..... ????? NO, You Cook everything at once, except of
>course the salad, I hate cooked salad :-), and then eat everything at once...
> That is NOT linear, humans are DEFINITELY not linear.

Heh. Gotcha. When I make dinner (let's say Coq a Vin, wild rice with herbs, a nice tossed salad, and chocalate torte...) I do the following:
1. get out the recipe for each thing
2. prepare the Coq a Vin
3. then prepare the wild rice with herbs
4. then prepare the chocalate torte
5. then prepare the tossed salad.

I do NOT cook "everything at once", I prepare things in order and let them cook "off-line" (no CPU processing necessary, it's all I/O) :-)

I do NOT eat "everything at once", a nicely prepared Coq a Vin requires time to savor the flavor, and I certainly wouldn't stuff a little bit of everything in at once.

That is pretty much linear. You are mistaking autonomos actions for "at the same time" actions. You may THINK you can watch TV and read your homework simulataneaously (multi-tasking), but your still going to fail tomorrow's exam if if you try it.

The human brain focuses on one thing at a time (conscious mind ... the nervous system automatically deals with lots of other stuff)

> The classic about walking and chewing gum, is a perfect example.... :-)

Walking and chewing gum are I/O intensive, and require absolutely no CPU cycles. :-) It's analagous (mildly) to reading text on your screen while Music Construction Set plays Bach (possible on both the Amiga and the Atari ST)

> Well, just remember, the vaxstation is at work, but my AMIGAstation
>is at my home, right where I get MOST of my work done....
>

Your AMIGA is at home, and you get MOST of your work done on it. I.E. you're a power user. For you, multi-tasking is "wonderful". I write a lot at home, and multi-tasking is an unecessary fribjob to accomplish that particular task.

I leave my REAL work (which requires things like UNIX and VMS and TELNET and all of those neat things) at work.

Actually, the argument is "Joe Average doesn't NEED Multi-Tasking to
accomplish the primary uses of a home computer"

writing stuff
filing stuff
retrieving stuff
playing games

> The 'oh but desk accessories are ok' is a specious argument.
>Desk accessories are a kludge-o form of multi-tasking. If you
>want to argue that Desk Accessories are a good thing, then you
>are arguing FOR multi-tasking.

Desk accessories (and maybe context switching) are all you NEED. The
argument here isn't whether multi-tasking is "neat", or that it doesn't
have its uses. The argument here is whether you should choose brand XX
computer "simply" because it has the capability of multi-tasking.

It's a nice fribjob, but not necessary to do stuff. Lots of microcomputer
owners know that, but Amiga owners somehow don't seem to feel that the
other features of their computer are enough to REALLY make a home user
want to buy one.

Personally, if somebody is willing to give me $1000, I'd buy one. (Same
deal for any microcomputer, folks .. I already have two, plus access to
two others, so why buy another?)

<< no use for multitasking in the home >>

Heck, Susan and John Averageuser don't even have to know that multitaksing is going on behind thier innocent unsuspecting backs. There are a lot of places where multitasking can be of use to us programmers and we don't even have to let the public in on our secret.

Here's just an idea. How about a sooper-dooper word processor with mind boggling scrolling and true multicolumn text display, etc. What John and Susan don't have to know is that while they are hunting and pecking their way through the current screen that a sneaky little task has been spawned to compose the adjacent screens. When the Averageusers scroll up or down *poof* (!) the next screen appears virtually instantaneously. "Hey Jack, NIFTY Amiga you've got! I wonder why my Eye Bee Umm can't do that. I keep hearing about OS/2 but I just can't afford it and the 2 two-megabyte option cards its gunna take to run it. Garsh!"

Case closed.

Happy Holidays!

From: tony@nswitgould.OZ
Message-ID: <3388@nswitgould.OZ>
Source record: 255483

I am making this inquiry on behalf of a partially sighted person
who has recently purchased an Atari ST.

What he is looking for is a Text -> Speech conversion program that
would allow him to hear the contents of a text file. I know that there
is a simple speech program available called ST-TALK that performs this
function, but only on text typed from the keyboard.

Does anybody know of a similar program that could read a file of text
and then speak it back? Are there sources available for the aforementioned
ST-TALK that might be modified to make it work on text files?

Please reply to me by mail, unless, of course, you think it is important
enough to post.

The program did the same thing on my machine (except vertically). Play
with the horizontal hold adjustment. It'll stay stable even after you restart
GEM (the screen will, that is).

You can probably attribute this to hardware dependencies. The monitor
used to develop the program may have been one of the original type, which is
slightly (well, a whole lot, actually 8-( ) different from the later ones.
Naturally, programmers aren't supposed to make programs dependent on things
like the refresh rate or solar flare activity, but there's them as does . . .

I kinda liked the "ST World" that my dealer used to carry, but he
stopped carrying it a couple of months before he folded. :-(
Did the newspaper fold too? Or did the go out of business becuase my
dealer no longer carried them? Or was it the other way around? ;-)

I wanted to receive the newsletter still, but not knowing if they still
existed, I wrote to them in Oregon. I have had no reply. I fear that
they are dead.

They were good, I thought, at getting news out early. I found
articles about about "IDRIS" (they spelled it IRDIS) and about the 2.5
Meg memory upgrade called "DoubleThink Plus" long before folks on this
net chewed over these subjects.

This little rag was published in an unheard of place called Roseburg,
Oregon. How they got their news, I do not know.

Does anybody know if they still exist?

>they just need faster integrated compilers, though :)

Ok, you asked for it .... here's my argument.

Actually I've got two. The first being background print spooler
type programs. These are handled so much more cleanly on a properly
multi-tasking machine than they are on a hacked-over single task
DOS ... And yes, I know that background print spooler gadgets can
run on single task DOS's ... I've seen 'em in CP/M, RT-11, Mess-DOS,
and many many others. But I've never been convinced that they
ever ran cleanly.

Anyway ... my main argument ...

I'm thinking ahead some time into the future when we'll have
ISDN running everywhere ... In order to handle network communications
cleanly we'll need to have multi-tasking. And this isn't just
communications as in start up a terminal program to call up
a mainframe at work. This is also things like mail daemons
and such that recieve e-mail while you're asleep (or away
or whatever).

For right now? Well, how about killing run-away processes?
It's real nice to be able to pop up another window, do something
like a "ps" to see what's going on, and kill things which need
to be killed. Oh, and I don't know for certain if Amiga can
do what I just said -- my 2000 hasn't arrived yet :-). But
my CoCoIII with OS-9 could do exactly that. (and I did exactly
that more than once). On a single task machine you simply reboot
the machine. Well, that's sorta messy. But also by rebooting
you lose all sorts of information you'd have been able to gain
if you could only do a "ps".

In short. I will never consider buying a single task machine.

>
I think you do the "average" computer user an injustice. He may
invariably start out able to deal with only one task at a time, but eventually
starts to think of things to do with his 'tool'. If there is any task that
takes a significant amount of time (minutes?) then a user eventually wonders if
there is something better he could be doing with his time than staring at a
static computer display. Once a user begins to learn of the uses that a
computer can be put to, he will start to demand more from his computer system.
If all he ever needs is simple word processing or file keeping then he can
find those in the simplest of computers (8-bit machines like Apples and
Atari's), but if he is a professional with a job to do, he will be looking for
tools that will help him do that job. Multi-tasking (and multi-user) systems
are tools for people that can use them. Not everyone needs multi-tasking, but
if you do, you don't want to have to go back to trying to get the job done
without it.

I think that the people who insist that multi-tasking is not useful
to the average user of a personal/home computer are missing a few
vital points.

Since these people dismiss multi-use multi-tasking as something only
advanced users will ever need, let me address what seems to most people
to be a simple, single tasking problem.

Terminal emulation.

The Digital Equipment Corp. VT100 terminal processes and displays characters
comming from the serial line, scrolls the display, blinks characters and
the cursor, and processes keystrokes into characters, control sequences and
state transitions. With few exceptions, these things do not interfere
with eachother. Even when in slow scroll, characters are sent when they
are typed rather than waiting for the scroll to complete. This is done
in a real VT100 with a simple multitasking kernal and several tasks, each
responsible for its own parts, and communicating with the others through
shared memory structures.

On the ST, most terminal emulators do this by checking for keystrokes
and incomming characters alternately, and processing them as they get
them, so if a sequence received from the serial line takes a long time
to process (say, split-screen jump scrolling), the characters typed at
the keyboard are not processed until that process completes, meanwhile
the host sending these characters has continued with what it was doing,
and the abort command (^C?) that you sent to the host gets there too late.
This is better handled using multi-tasking, though async. I/O with completion
routines (ala RT-11) or "unsolicited character AST" (software traps on
character reception) and timer routines (ala RSX-11M) are reasonable
substitutes, but these are not available on the ST, Amiga, Mac, MD-DOS,
most UNIX-like systems, or most other personal scale machines.
Unix systems do this with multi-tasking (fork). Most personal computers
use a similar approach to TOS. With a graphics terminal, the problems
with this approach become more visible.

Multi-tasking by itself will not solve all of the problems in terminal
emulation. The kernal/OS should be designed to allow close cooperation
between tasks.

Other "average user" applications that work better with multi-tasking --
Networking/Electronic mail, file transfer, interactive debugging,
real-time simulations and games.

Multi-tasking kernals are not large and complex. I helped write a simple
multi-tasking real-time kernal for a M68000 based system with message

passing, streams, async I/O, mark-time requests, event notification
and I/O completion routines, and event waiting for a project I was working
on at a previous job. This system was written mostly in C and had a built-in
debugger, yet occupied less than 16K of code for the kernal. It did not have
any file-systems, though. This kernal was more efficient than GEMDOS,
CPM-68, MS-DOS, yet was smaller than any of them (I know, no file system,
but one could have been added at minimal cost -- it would have been a
task (like in MINIX)).

To sum it all up:

The average user on a limited disk/memory machine can use multi-tasking
to great effect. What the average user probably does not need is a
multi-user system (like Unix or VMS). Multi-tasking systems do not
need to add alot of overhead and are not difficult to design or
program for.

Disclaimer:
UNIX is a trademark of Bell Labs, AT&T, or someone who looks like
them. RT-11, RSX-11M, VT100 and VAX are trademarks of DEC. MS-DOS

>Ahem. In case you haven't noticed, the "masses" are NOT buying microcomputers.

I believe he meant the masses = people who buy microcomputers.

At any rate, people at large ARE buying microcomputers. How many of
you folks parents use or now own a computer ? See what I mean.

>They certainly aren't going to "need" multi-tasking systems, and would

Then whats all this OS/2 nonsense all about then eh ?

>Computer chauvenism. People will go to great lengths to "prove" that a
>feature of the operating system or hardware is what makes a particular system
>better. Of course, we all have a vested interest in that "proof" -- we
>just don't want to believe that we bought an "outdated" computer. Hah!

Oh, I see. If I had a 20,000 Mhz 68090, but said it was a reason to
buy THAT computer it's computer chauvenism ? Right.

Next.

>People want computers (when they want them at all) to DO SOMETHING for
>them. In the majority of cases with the Atari ST and the Amiga, that
>"something" has been:
>
> writing stuff
> filing stuff
> retrieving stuff that's been filed
> playing games
> programming all of the above

Speak for yourself, you nit. You have no idea what *I* do, or what *I*
need.

>Most of those who read these forums fall under the "programming" category.
>Of course, for programmers, multitasking can be a delight. For the person
>who is writing a term paper on the microcomputer, why bother? If you have

Why bother ? WHY BOTHER ? How bout being able to call up as many editor
windows as you have memory for ? I've had 5 going at once, and thats
all I ever needed, but if I have more than a megabyte I could open

more. I use Apollos at work, with 2 1/2 megs on a DN300 and can
only open up 18 or so edit screens. I f I had more memory there...

>access to two programs (ala Multifinder or perhaps through a "desk
>accessory" [IBM PCs have desk accessories too, folks]) you already have
>as much power as you're ever liable to need in most environments.
^^^^^^

Speak for yourself, nit.

>It's totally "neat" to download a file and play chess at the same time.

Fer shure dude, like totally awesome, real rad, man.

I dont like chess. I like being able to simultaneously edit, compile, link,
run the program, ray-trace, run a comm program and robortoff. I have
been doing this for over two years on the amiga, and 1 year on Apollo's.

I could not go back to a single tasking computer, nor would I accept
a job programming one. Stone age.

>But I've never come across a time when it was necessary to do so. So, let's
>get off this kick about multitasking being a "necessity" in a computing
>environment.

Alright, thats it. For the last time, just because you dont want it/dont
need it/can't understand it, don't for a second presuppose others
dont want/need/understand multitasking.

793. Failing Disk Drive & Strange TPA pointer

Newsgroup: comp.sys.atari.st
Date: 1987-12-22 09:36:49 UTC
From: neil@cs.hw.ac.uk
Message-ID: <1606@brahma.cs.hw.ac.uk>
Source record: 255492

Boo hoo the disk drive on my 1040ST is not working. I know it is the drive because I have swapped it in other machines and the problem moved with the drive. The symptoms are strange in that it reads every track on a disk fine but has trouble writing. I say trouble because sometime it formats a track ok sometimes not, but never a whole disk. I had a look at a track it had tried to format and found corruption (gap bytes inconsistant & data damaged ie $E5 corrupted.) If I can't fix this drive I will have to buy a replacement and that will kill my slim chance of being able to afford a hard drive.
I phoned a company that upgrades the internal SS drive in a 520STFM to DS and asked if the same drive could be fitted inside a 1040. They said no, which I think is pretty strange since I thought (as most do) that the 520STFM was just a 1040 with a lesser drive and some RAM missing. Has anyone else put a different drive in their 1040 or repaired the original one?
If so please advise me.
(Note: Our machines will be down(ish) from 24th Dec to Jan 5th)

Another interesting point:
I wrote a little C program print out a programs base page address and the operating systems start of TPA pointer (at $432). When run it printed out a high base page address eg. $23??? and $A100 for the start of the TPA which is to be expected. But when I put the program by itself in the AUTO folder on a floppy and booted up the machine with a power down/up it came up with $A204 and $A100 respectively. Can anyone tell me why the OS takes this memory away?
I know I have a megabyte to play around with but I like to ponder/solve such mysteries.

Thanks in advance and a Merry Christmas to all who know me or would like to.

Neil Forsyth (the man with the ROFDD (Read Only Floppy Disk Drive) Help!)

Bad example. OS/2 *IS* nonsense. IBM found out that just about everyone who ever wanted a PC or compatible has one by now (including my Dad, maybe he'll figure out how to boot it someday.), and the only way they can make money on PC's is to make all those users think they need to spend big bucks on software, hard disks, and extra RAM to retain that "compatibility". Not only that, they then find out that even their high-speed AT-286 ain't fast enough, and they gotta upgrade to a 386. OS/2 is a plot to sell more hardware.

So I take it your saying that you don't want to believe
that your Atari-ST is an obsolete machine?

What does vested interest have to do with this? Either
multi-tasking is usefull or it is not! Of coarse we all
have out-dated machines if your going to include the state
of the art. Lets talk about the PC world, OK?

> Robert Gardner
>

What about the example I gave of two resident programs cohabitating
and interacting even though written in different Languages? While
you don't NEED to have multi-tasking to do this, it makes an otherwise
complicated job very much easier, and therefore much more likely to be
successfully accomplished. It certainly is attractive to me because
it means I don't have to "share" any of my source with someone whom
I may want to collaborate with.

Carousels are fine for most things. However, for applications
to which they are unsuited, using them can be a pain. Also, for
us programmers, within a single program multi-tasking can be
invaluable.
For instance, If I were writing a communications package, one
feature I might include would be a "secretary". The secretary
would be capable of performing certain mundane tasks for the user.
For instance, it could be used in conjuntion with a phone-list to
re-try busy numbers periodically, and to interrupt the user if
the number becomes avaiable (ie: rings). Perhaps it might be
smart enough not to recall if the user input level is high, or
to ask permission before making the attempt.
This would all happen with no unneeded interruptions to the
user.
THE POINT IS THIS: As a programmer I find the idea of writing
such a program as being much simpler with multi-tasking facilities
than without them. If I were programming an Atari, which I take
it does not have multi-tasking, I would have to consider the job
to be far more difficult than it would be on the Amiga. For me,
multi-processing is just another tool I can use or not use. The
user might not even know it is happenning.

Regaurdless of what you think of the "average users'" capability
to utilize multi-tasking to their benfit one thing is certainly
true; They can never use multi-tasking to their benifit if the
machine they're using doesn't support it. Never!

To me NEVER is an ugly word. Kind of like DEAD. This is why we
Amiga people like the Amiga so much. It has a "no limits" philosophy.
The fact that a machine is built around a bit more than "how can we
make a machine that will ring all the right bells (sound, graphics,
windows,etc...) to appeal to the uninformed masses so we can make
a quick buck" philosophy so common in this industry is refreshing.
Multi-tasking was included in the machine because it was feasable
and thus the "no limits" philosophy demanded it.

==========

My question for you is, what do you have against multi-tasking?
Take OUR (all of us who have given testomonials) word for it that
the disk swapping "nightmare" is indeed just a bad dream. This
just does not happen. The switching overhead seems to be negligable.

I figure you have a choice of having a thing or not having it.
Isn't something better than nothing? If you don't want to use it,
just turn it off!

Give me an example of why it is better NOT to have mult-tasking.

And one last point: large numbers of these machines are going
into homes, and in those homes, are being used by children. Perhaps
little 10 year old Jonny wants a computer to play games on, but
a few years from now he might want to program. If so, he might
be totally familiar with multi-tasking aspects of programming before
he reaches High School if his computer includes it. Otherwise...

Merry Christmas,

Wade.

Uh...one thing that a single-tasking system won't let me do is use pipes (reasonably, as opposed to the way MS-DOS emulates them). "Naive users don't use pipes," the response will come. The problem is one of education.

Hi,
I use the Canon Color Ink jet printer, which is the same as the quadram quadjet (and Radio Shack Color Ink jet, etc) with a few ROM hex codes changed. I like the color output, it takes under two minutes to print a good quality neo/degas/tny format picture, and the color reproduction you can acheive is excellent. There are PD drivers available (very simple ones), or I know of this great product called Quaddump that you can buy (:-) it is a special version of CANDUMP that I developed for some distributors right before DAK went and bought all 25000 Quadrams out from under the distributors :-(...I might be making this program PD or shareware if I ever get some free time to go in and take out all the advertizing and copyright info in it). The quadram goes a long time on a $8 ink cartridge (about a year for me...around 8 rolls of paper). The paper runs around $10/roll for the good clay based stuff, but it is good for several hundred pictures (300?). The quadram has a pushbutton inkjet purge, so cleaning the jets (or purging airbubbles), is very simple.
>!!!! PLEASE SEND EMAIL ONLY !!!! - I don't read most of the groups
Sorry, but I thought the other groups might be interested...Simply because it is fairly easy to get these printers cheap nowadays (I have seen the Quadrams going new for less than $200) and having a color printer is really worthwhile if you have an Amiga, color ST, or a Mac II. One word of caution, though...don't expect to print out program listings on one of these! Too expensive and the fonts are pretty horrible for listings...

-Todd Burkey
trb@stag.UUCP

BTW, CANDUMP/QUADDUMP is an ST program. There are some good drivers, however, on the Amiga that are PD and someone out there may have also written a similiar 'smart' color dumper as well.

798. Multitasking??

Newsgroup: comp.sys.atari.st
Date: 1987-12-22 14:44:00 UTC
From: TCORAM@UDCVAX.BITNET
Message-ID: <8712221448.AA21644@ucbvax.Berkeley.EDU>
Source record: 255496

After reading all the stuff posted about multitasking, I feel like throwing
in my 2 cents.

How many people really (I mean REALLY) use true multitasking?
Some things that would benefit: Downloading
Compiling
Ray Tracing....
All the above things would make life easier if run as a task (while you
can happily go and continue work elsewhere on the computer).

But.... Downloading can be effectively coded as a background task on
machines like the ST without need for true multitasking. The same is not
true for compiling and number crunching. *sigh*

Well, let's consider context switching (like SWITCHER on the Mac):
I am in a word processor (or editor-- where most programmers spend
90% of their time). I want to compile my program, so I freeze the
editor and 'switch' to the compiler (or shell that loads compiler)
and compile the program, looking for errors. I switch to a CLI
to look for the files created by the compiler. I switch back to
the editor. (repeat 40 times or so).

How would true multitasking help? I really don't want to go back to editing
while the program compiles. I have not even corrected the possible errors
the compiler has barfed on! In the above situation, true multitasking really
doesn't make much a difference.

For Applications:
Does my Spreadsheet really have to continue running along
with my Wordprocessor? Do spreadsheet calculations take so
long that I waste valuable time (time I could spend editing?).
Would context switching do? Probally.

YES! There is a need for multitasking. But there are limitations on such a
small machine. The more you task, the slower each application runs...

On our VAX/VMS system, I do a lot of SPAWN/NOWAIT and batch jobs to do things
such as directory cleanups and SPSSX statistical calculations. I would die
of boredom if those things weren't done via tasking.

Give me a 4meg ST with a 68020, real memory management, VIRTUAL memory and
40meg mass storage and I can show you what real mutlitasking can do...

I've been following this for a couple of days, and here's my two cents:

Having used a multi-tasking OS on a PC (QNX -- not a bad system) for several years, I found that I tended to use it as a "switcher". That is, I would run one program in one virtual screen, and run another in a different screen. A hotkey is used to flip screens, up to a maximum of four. Now, QNX does offer Unix-type background tasks, but I didn't use them much. If your background compile runs amuck, it's hard to get back under control.

However, I don't think anyone has considered that one program, from the user's point of view, may actually be composed of two cooperative tasks. For example, a terminal emulator can have an input task and an output task, each of which blocks when it has nothing to do. There's a case when multi-tasking is nice even when you're only doing one thing.

So, my vote goes for multi-tasking. You can do full-blown power things if you want, you can do "switching" if you want, you can do just one thing if you want, but at least you have the choice. Granted, a single-tasking system is "all you need" to do work, but if the multi-tasking system can be provided for reasonable cost, would you turn it down?

So, did I hear someone say they were offering a multitasking version of GEMDOS for my ST? :-) (And when will ST Minix be ready?) (And when will the price come down on ST Idris?)

Yes, you can order pulication RS-232-C form Electronic Industries Association, 2001 Eye Street, Wash DC 20006. It is about 24 pages. Back when I got mine about 10 years ago, it cost $5.10.

While going into excursiating detail about the elctrical characteristics of the singals, it makes omits two useful items. First the temporal relationships of control signals. (It does say which ones should be on/off simultaineously for certain conditions.) Actually, RS-334 defines the temporal reationships. Second, RS-232-C says nothing about the physical design of the connector beyond recommending that it have 25 pins.

Section Three says:
3.1 The interface between the data terminal equipment and data communications equipment is located at a pluggable connector signal interface point between the two equipments. The female connector shall be associated with, but not necessarily physically attached to the data communication equipment and should be mounted in a fixed position near the data terminal equipment. The use of an extension cable on the data communication equipment is permitted. An extension cable with a male connector shall be provided with the data terminal equipment [Ha! --Bill]. The use of short cables (each less than approximately 50 feet or 15 meters) is recommended; however, longer cables are permissible, provided that the resulting load capacitance (CL of fig. 2.1), measured at the interface point and including the signal terminator, does not exceed 2500 picofarads.

3.1.1 When additional functions are provided in a separate unit inserted between the data terminal equipment and the data communication equipment (See section 1.7), the female connector, as indicated above shall be associated with the side of this unit which interfaces with the data terminal equipment while the extension cable with the male connector shall be provided on the side which interfaces with the data communication equipment.

That's it. But Appendix I suggests:

Interface Connector

While no industry standard exists which defines a suitable interface connector, it should be noted that commercial products are available which will perform satisfactorily as electrial connectors for interfaces specified in RS-232C, such as those

connectors meeting Military Specification MIL-C-24308 (MS-18275)
or quivalent.

It is not intended that the above reference be considered as
part of RS-232C or as a standard for the devices to which
reference is made.

Holy avoiding the issue, Batman.

Ahhh, the beauty and simplicity of Midi cables. One pin
arrangement, one set of allowable pins, one baud rate.

Enjoy the Holidays,
--Bill

Of course, you can get OS-9 (and IDRIS) for the Atari ST. So there. You can multi-task to your hearts content, regardless of the machine. BUT I still insist that, for the non "power user" there's no need for it.

I didn't want to jump into this before, as it sounds like a religious argument, but I have to agree with rminnich. Computers are here to be used by humans, not to force the humans to limit their ways of doing things.

I can't believe this discussion. Here we are, all us good hacker types, arguing that Joe Average is Too Limited, The Poor Soul, to really Appreciate the Beauty of Multi-Tasking (*cue Heavenly Choir*)

You would be surprised what Joe Average can do. He is pretty smart. I have seen this any number of times: once the light goes on in Mr. Average's head, he (and she, of course) will never want to give multi-tasking up.

Exactly. My girlfriend (a recent convert to computing) often says things like "But why can't I just do this while that's going?", or "Why do I have to get out of this thing just to look at that thing?" Often I have a real hard time explaining why what she's asking for is any harder than doing a single operation. It seems "natural" to her that the computer should be able to do more than one thing at a time, and that's how she expects to use it. I'm not a psychologist, but I bet if you could find one that's studied this area, they'll tell you that what we hackers call multi-tasking is similar to how people work and think.

The 'oh but desk accessories are ok' is a specious argument. Desk accessories are a kludge-o form of multi-tasking. If you want to argue that Desk Accessories are a good thing, then you are arguing FOR multi-tasking.

Right. Sure, it's possible to cut corners on the implementation, and get some of the benefits of real multi-tasking cability without doing all the support necessary for the real thing, and I'm not saying that's not useful. Just don't fool yourself into thinking that what you're doing isn't an attempt at a multi-tasking envronment.

804. help on gdos

Newsgroup: comp.sys.atari.st

From: cyliax@ea.ecn.purdue.edu
Message-ID: <1357@ea.ecn.purdue.edu>
Source record: 255352

I need information on gdos. I need to know how to write new device drivers,
or find out about someone that already has device drivers for what I want.
I am interested in device drivers for the following.

Gemini 10 (Gemini 10x will probably work)
Hp 7221 Plotter

Unix plot format
PostScript

All these device drivers will have to be able to write to a file instead
of just running it down the printer port. I would prefer information on
how to write the device drivers over the actual device drivers, but I'll
take what I can get. I have heard that this information is available to
"registered developers".

And now for a little Flame .....

/******** FLAME ON **********/
I don't really want to be a "registered developer"; I don't feel that
paying $300 for a buggy compiler and skimpy docs. is really worth it.
Beside I'm not "developing" software, all I want is documentation
so I can use the software that I buy. The software package that I bought,
uses gdos and the company doesn't want to give me docs on gdos, since
I can get the docs by becoming a "registered developer".
If you want people to use your product (gdos in this case), you'd better
supply documentation for it at a reasonable price.
/******** FLAME OFF ********/

Thanks,

One particularly nice effect of having a personal computer with real multitasking appears when software products are developed with that capability in mind. Using this approach, a program (for instance, a CAD package) can be written to communicate with sub-modules running as separate processes and communicating with the "main" program via messages.

In this fashion, modules to provide new and special-purpose features can be developed and distributed (either by the original manufacturer or third parties) after software is released. Users can choose whether or not such modules are of interest to them as they are developed, and can incorporate them into the system or not as they see fit.

Many applications could benefit from such a modular approach and although it may be possible to achieve similar results on other machines, true multitasking provides a powerful and aesthetically pleasing environment for extensible software systems. As an Amiga owner and programmer, I find that exciting.

>>>spoolers.

>I'm still waiting to see if someone can come up with a use for TRUE
>multitasking that a typical home user would find very handy but that
>cannot be satisfied by a simple 'carousel' approach. There probably

With true multitasking, when my computer is doing something that
takes a while, like formatting a 200 meg hard drive, recalculating
a spreadsheet, balancing my checkbook :-) or anything that takes the
computer a while to do, I am free to use the computer for something
else.

BTW, when you have a single-tasking computer, tack on some sort
of 'carousel' (ie Desk Accessories, Switcher, MultiPet, or whatever),
add interrupt driven background programs with limited capabilities to do
print spooling, etc. , tack on multi-tasking shells that run some
programs , why not go the extra mile, and clean up your world and
put in true multitasking ? All the problems with TSRs, spoolers,
etc. become very simple if the machine itself multitasks.

I really thing this whole thing is just a strawperson argument. After all
Multitasking is available for the ST too. (but not standard, like on the Amiga
:-). ST owners can get OS-9, a Un*x-like multitasking perating system, right ?

This argument comes down to, not on which computer is better, but
on whether you wait for your computer or whether your computer
waits for you. Remember, you never have to use the multitasking
if you don't want to...

Frankly, if the BIOS was written re-enterantly, there would be little difficulty in adding multitasking. It could be done for those who use it, and those who didn't could ignore it.

So is it worth the effort making the BIOS re-entrant? Well, I know that there has been some discussion in this group about the various problems encountered in handling interrupts that would not have been encountered in a re-entrant BIOS.

Consequently, a multitasking system is the logical outgrowth of a good design.

in article <8712211937.AA01474@ucbvax.Berkeley.EDU>,
gjwelych@SUNRISE.ACS.SYR.EDU ("Welych, Gregory J.") says:
> What in the Atari drives senses the change of media?
> And how does the drive signal this to the ST?

The media-change sensing is done using the write-protect signal from the drive. The assumption is that when you take a write-enabled disk out of the drive, the write-protect sensor will pop up, and the drive will signal "write protect" to the controller. When you put another disk (or even the same disk) in the drive, the write-protect sensor will be pushed down again and signal "not write protect."

When a disk is really write protected, of course, there will be no transition on the line. Because of this, write-protected disks go into the "maybe changed" state 1 sec (I think) after the last disk access. (The assumption is that you won't change from one write protected disk to another within one second).

When a disk is in the "maybe changed" state, the next access (through RWABS or maybe Floprd) will check the serial number of the disk in the drive. If it hasn't changed, then the disk hasn't changed, either. This is another assupmtion: you should not have two disks with the same serial number.

If your drive suppresses write protect changes when there is no disk present, then switching from one write-enabled disk to another will not cause the transition, and the BIOS will not sense media change.

Sorry. Nobody said it would be easy.

In lots of articles, with lots of words, the debate has raged about multitasking -- is it useful to all, or is it just for the "power user"? (I thought *I* was a power user -- after all, I pay my electric bill every month. . .)

The user doesn't even have to know that he is using a multitasking system to derive benefits from it. As programmers become more familiar with the Amiga, the use of multitasking within what looks like a "single program" will increase.

Think of a text editor or word processor that spawns a low-priority process to perform all I/O, passing the data back and forth to the main module via messages. The editor can now be used on files that are much larger than main memory, because it is no longer necessary to have everything in memory at once. Because the I/O process can run asynchronously, it can keep the editor supplied with the appropriate parts of the file with no obvious delays.

This same idea could be used by game designers to reduce or eliminate the delays associated with loading a new "room" or whatever. If sufficient memory is available, a low-priority process can load in the closest new piece of the landscape. Then, if the user enters the room, the data is already in memory, requiring just a fast transfer. If the user goes the other way, nothing has been lost -- the CPU cycles would have been wasted otherwise (remember, we're postulating a "non-power" user who won't run two things at once).

And yes, this could be done without multitasking, but it is easy with multitasking. This will encourage the proliferation of programs that use multitasking internally. And we'll all benefit -- even the non-power users!

Steve Rice

812. pc-ditto, file formats, devices under msdos

Newsgroup: comp.sys.atari.st
Date: 1987-12-22 19:57:23 UTC
From: tom@jiff.berkeley.edu
Message-ID: <1475@cartan.Berkeley.EDU>
Source record: 255361

.
I have just spent about 4-8 hours over the past couple of days
setting up and using pc-ditto with msdos 3.21. I have had much trouble
transfering files between the st and the virtual pc, though I have been
sporadically successful. Does anyone know a great deal about the
incompatibilities between the file systems? I have been told that disks
formatted under msdos will work fine with tos, but I have found that this
is not always true. I could not access some of the files on my msdos
master disk under tos, though under msdos, I could easily access them.
Also, I have formatted disks under msdos, copied files to them, then when I
return to tos/gemdos, I find that no files show up in the disk's window.

Background: I have a 1040ST with an internal DS disk drive and an external
5 1/4" IB systems disk drive. I am using res.prg to change the step rate
for the external drive, and I have used dcformat, fmt (from IB systems),
pcd_dfmt(sp?) (from the pc-ditto company) and msdos format.

On a related subject, what are the problems with using a fixed
disk for both msdos and tos?

Thanks in advance,
Tom Erbe-Technical Director-Center for Contemporary Music-Mills College
tom@mills.berkeley.edu -or- tom@jiff.berkeley.edu

813. Multitasking... It's not harmful!

Newsgroup: comp.sys.atari.st
Date: 1987-12-22 22:09:56 UTC
From: ali@rocky.STANFORD.EDU
Message-ID: <890@rocky.STANFORD.EDU>
Source record: 255363

In article <3279@umn-cs.cs.umn.edu> davidli@umn-cs.UUCP (Dave Meile) writes:
>But I still insist that, for the non "power user" there's no need for it.

Ok, fine... Assume Joe Average buys an Amiga and never ever explicitly uses multitasking. Ie, he never runs more than one program at a given time.

What does he lose by buying an Amiga? An extremely small percentage of CPU, totally negligible. I don't think anyone will argue that Joe is paying extra for multitasking.

What does he gain? Well, probably nothing overall... But, he does now have ability to move/drag/arrange windows, pull down and examine menus, click on buttons, all while he might be doing some CPU-intensive operation (like reformatting a document). On the Mac, for instance, your mouse loses it's ability to drag windows at certain times, and I've seen users wonder why... (Don't tell me that "average users" do not want to fiddle around with windows and their mice. Especially when they're waiting for some operation to finish.)

On the other end of the spectrum, you have the programmers, and I think you've seen examples of how heavily they use multitasking in the many messages posted in the last few days. Both during development as a tool and in their programs as a means with which to write cleaner applications.

So, David, there's nothing wrong with having multitasking on your home machine. People who understand it and who like it will use it, and people who don't know about it or who don't care about it, won't. The OS and applications might use it behind the user's back to improve overall performance, but that's invisible to the users. And if we're talking about the Amiga, then, even if the user doesn't use the multitasking explicitly, he or she still has a machine that is very powerful for it's price range.

If you think the lack of multitasking would make the Amiga a better machine, then please explain why. Wouldn't it be nice if the ST were to suddenly become a multitasking machine without losing it's ability to run all existing applications and without any penalties on performance/price?

Ali Ozer, ali@rocky.stanford.edu

814. speeding floppies?

Newsgroup: comp.sys.atari.st
Date: 1987-12-22 22:15:31 UTC
From: CSYSMAS@OAC.UCLA.EDU
Message-ID: <8712222223.AA29981@ucbvax.Berkeley.EDU>
Source record: 255364

I have timed the ST floppies with various sector skews on
consecutive tracks. Here are the timings for writing a 32k file
onto a "just formated" disk (single sided). The timings are for
a TOS Fwrite of a contiguous 32K storage area (on good boundary)
from assembly. The timing was done with the TOS 200 Hz counter.

times in seconds
w/ verify no verify
standard (TOS fmt) 6.32 3.26
skew 2 (1,3, 6.11 3.08
3 (1,4, 5.79 2.94
4 (1,5 5.61 2.76
5 (1,6 5.43 2.38
6 (1,7 5.45 2.39
7 (1,8 5.26 2.21
8 (1,9 6.49 3.44

6 or 7 might be a good choice (if I was going to use this).

The following were measured (some time ago) using a normal format w/ a
modified TOS routine (1 bit changed):

"fast" TOS 3.375 1.765

The change to TOS consists of removing the "seek verify" bit
from the seek command (just one bit).

This has three effects:

1. The one sector time the verify takes is saved.
2. The head settling time is also skipped (30 ms which
costs about one more sector time).
3. A seek to the wrong track isn't detected until a read or
write is tried (both read and write include the seek
verify operation when they check the ID field).

#1 has no bad effects and saves a full disk rev when sequential
tracks are being read/written (which is a usual case with large
program fetches for example).

#2 sounds bad, however lets look at the actual cases:

a. motor off
(motor spin up delay is 1 sec, head should settle here)
b. seek to the same track (no actual head movement)
No problem here.
c. seek to other side of DS disk.

Same as a.
d. seek to next track (1 track seek = 3 ms seek time)
The time between sector 9 and sector 1 on a NORMALLY formated
disk crosses the index point. There is about 24 ms of gap and
padding here so the head will settle for at least 20 ms before
sector 1 is encountered. I doubt that the heads really take
30 ms to settle, more like 10 to 15 ms (I don't have the drive
specs).
e. long seek
TOS floppy routine could add 10 to 20 ms delay after seek.
(This isn't a frequent case)

#3 can be fixed with better code in the read/write routines
to handle a previous seek error (which would be detected during
the read or write).

The result of this is that I think it is a mistake to use
skewing. Corrected TOS routines would run slower on the skew'ed
disks (ie: all the skew'ed disks would need to be reformated
back to the std fmt to get the fastest speed) and might possibly
have problems with head settling time (#2d above).

815. Re: Atari's Marketing Approach

Date: 1987-12-22 22:20:27 UTC
From: stephen@plx.UUCP
Message-ID: <909@plx.UUCP>
Source record: 255365

Atari's problems are not unique in industry and are as follows.

First priorityS are gross margins and short term profit.

Some where in the middle comes market share.

Near the end of the priorityS are long term profits.

At the end of the priorityS are quality and customer satisfaction.

If you can get you gross margins and profits up without having
good custormer satisfaction and quality, that seems to be ok with Atari.

If competition forces you to consider these last two priorityS, then
that must be unfare competition and and we need some new trade
laws to put restrictions and tarifs on imports. Bah Humbug. If you
can't get those last two down, you deserve to go out of busness to
some one who can.

Stephen Heath

P.S. If have owned Atari Computers for 5 years. At one time they
gave more value per dollar. Now, I have found it more cost effective to
buy a Hard disk and second disk drive and add an AT System in as
an extra. I could not justify the cost of an atari compatable hard
drive and second floppy. It may have cost somewhat more, but my value
per dollar was MUCH!!!! greater.

It 'would be nice' if Atari provided an IBM-PC/xt compatible i/o channel adaptor with their standard (ie, AFFORDABLE) 680X0 based microcomputer line. This would combine the advantage of a large (16-megabyte minimum) DIRECTLY-addressable address space with the advantage of a large, existing, AFFORDABLE selection of IBM-PC/xt peripherals. In addition, we would like to point out that the Motorola 680X0 instruction set is much friendlier than the Intel 80X86 instruction set, and that the Motorola math-coprocessors tend to be MUCH faster than their Intel (NMOS=overheat) equivalents. Now, if only Atari would allow their GEM rom-based operating system to operate with the (faster) 68020, and supply a functional socket for the 68881 math co-processor.

> appear.

Started shipping this week. Finally! Look for it at dealers within the next couple of weeks.

> Wordperfect isn't perfect

I'm helping to beta test the next release of WordPerfect. Despite the problems, it is still awfully good. And the support is fabulous.

Sorry, but the Macintosh IO system fully supports async IO with completion
routines. The only problem is that completion routines run at the
interrupt level (Memory Manager calls not allowed) so you have to pre-allocate
storage. You could also install a "listener" procedure (really a daemon, I
guess) into the vertical retrace queue, which would then get called every
1/60 second (between video frames) and could take care of sucking chars in off
of the port. There's even a device-independent millisecond timer manager if
you need it.

>
>Has anyone had any experience with BMS and the package they sell that allows
>one to use a cheap IBM-PC style drive to hook to an Atari ST? I'm

I have seen the various replies to this original query and am amazed that nobody even mentioned an alternative to BMS. Well... here goes:

Being the owner of two BMS kits (one for a Micropolis 1325 on a 1040, and one for a Seagate ST506 on a 520+), I have seen how Berkley Microsystems has improved over the last year or so. I think their present-day package is well put together and easy to build. I have only had two reservations about the kit: 1) The non-standard format used on the disks, and 2) THAT SHORT CORD!!

Until a recent (fairly) Atari Fest in the area, I was under the impression that the BMS kit was the only one out there. At this fair, I was introduced to ICD, Inc. (I don't know what it stands for.) and their ST Host/Controller Kit. Among its advertised features are:

- built in battery backed-up clock
- 7 SCSI devices and daisy chaining
- 100% compatible with Atari and Supra
- built in verify and error retry

They answered my "short cord" problem with their three (3) foot cord!
Anyway, I was quite impressed with their presentation and brochures.
(If only I had known about them earlier...)

Finally, I'm not really knocking BMS. I'm letting you people out there know there is an alternative.

John Iarocci I am not affiliated with any company

823. Re: drivers for new printers

Newsgroup: comp.sys.atari.st
Date: 1987-12-23 04:58:45 UTC
From: Randy_Captain-Magic_Holcomb@cup.portal.com
Message-ID: <2125@cup.portal.com>
Source record: 255373

I just got an NEC Pinwriter P2200 for $400, and I think it's a killer little printer. I did have some fun trying to track down a utility that could do a good screen dump (ALT-HELP) but I did find one on GEnie (Delphi?) that works well when you tell the driver it's a P7. (and the P2200 allows you to kill the tractor feed to, for single-sheet feeding. Nice touch.)

Oh, I see. I you have a singletasking operating system you
are just a user, but you have a multitasking operating
system and you do two things at once, you are a power user ?

Such silliness.

In article <1607@wiley.UUCP> bob@wiley.UUCP (Bob Amstadt) writes:
>The Kuma Resource Editor is now unavailable. The product has been
>discontinued.
>--

This surprised me, because I know (a) that it is still in the shops in the UK; and (b) it is listed in Kuma's very latest (Dec 87) product/price list. Since I was writing to Kuma anyway (to get myself de-duped from their mailing list -- one copy is enough) I asked about this. The reply (from Jon Day, their Marketing Director) says:

Regarding K-Resource in the USA, all our products are available and distributed in America by C.S.S of Addison, Illinois, they can be contacted on 312-620-4444. K-Resource was also distributed by Antic, however they seem to be concentrating primarily on entertainment titles now, whilst being unhelpful regarding other products. We are workiing to further strengthen our distribution in the USA next year.

So, K-Resource *IS* still supposed to be available on the West of the pond. But apparently not from Antic. Suggest you try (or have your dealer try) this C.S.S. lot. Not worth a transAtlantic phone call to me to find out...

Failing that, Kuma themselves are Kuma Computers Ltd., 12 Horseshoe Park, Pangbourne, Berkshire RG8 7JW, England (International phone 44-7357-4335), though I confess I'd be reluctant to try international mail order myself.

(As usual, I have no connections with any of the companies named above, except as an occasional purchaser of their products for my own use.)

Happy holidays.

827. Cheap Harddiscs

Newsgroup: comp.sys.atari.st
Date: 1987-12-23 10:30:36 UTC
From: lbn@iesd.uucp
Message-ID: <196@iesd.uucp>
Source record: 255377

Considering the relative high prices on ST-Harddiscs, and the forever falling prices on PC compatible harddiscs, it seems natural to attempt interfacing one of these to the ST.

We are aware that there might be a lot of problems. Not knowing the PC-hardware in details, one of the problems one could foresee is the existence of a DMA-controller on the PC-controller card. Since the ST is allready fully equipped in this respect, the PC-DMA might get in the way. Another problem is the fact that, when booting up, the ST makes certain assumptions on the part of the (possibly) connected harddisc. I.e it has to understand certain commands (bitpatterns).

We saw the solution offered in "ST World", in which two adapterboards were used. One to convert the ST-interface to SCSI, and the other to connect a bare industrystandard drive to the SCSI. The cost of these two boards plus the bare drive, however, nearly equals the price of an ordinary ST-drive (at least in this part of the world, don't tell us about high taxes :-).

So, if anybody out there has any suggestions in this respect, please let us know.

We will summarize any received mail, in a posting to the net.

Source record: 255379

I am quite new, and still naive, to my Atari ST. I have programs that either only output to the screen or to the printer port! So as not to reinvent the wheel, what I'm looking for is an assembler or C program which would redirect the output of one of these programs to an ascii file rather than the printer. You see, I don't have a printer locally on my Atari. Thanks a million.

Merry Christmas,

Ralph P. Sobek

>Now to my main question:
> What in the Atari drives senses the change of media?????????!!????
> And how does the drive signal this to the ST?????
>
>Thanks in advance for any help,
>
>Greg Welych.

A couple of months back, my 1040ST suddenly blew its internal
doublesided floppydrive. Since this was the only drive connected, it
was a disaster ! My beloved Babs was (almost) dead. She would
eventually boot, and come up with an empty desktop. That's a boring

game (it wasn't so :-) at the time). What went wrong, I don't know, I tried plucking everything apart to check for any loose connections etc., but no luck. A custom chip in the drive did get awfully hot though.

To summarize, I found myself in a situation somewhat similar to yours: I had to get a new drive somehow. Not wanting to pay for an original Atari-drive, I came up with a reasonably cheap solution. A little research revealed that the internal drive used a standard Shugart interface (both in terms of signals AND connectors). So the problem could be reduced to finding a (cheap) bare drive equipped with the Shugart interface. That's easy enough. I picked a NEC-drive type 1036A, a drive known for its reliability and quiet operation. It's also smaller than the original Ataridrive (which seems be from Hitachi), so with a little fiddling I managed to get it crammed into place. (I had to make some minor changes to the ST-case). The proof of the pudding ? Well, I removed the old drive, plugged in the new one, turned on the power, and Babs made a successfull boot from disc and has been happily humming ever since.

So to connect another external drive, all it seems one has to do is:

A) Buy a bare drive.

B) Pick up the floppysignals from the ST's external floppy interface. The connections are as shown (seen from the rear):

```
11 10 PIN SIGNAL INPUT/OUTPUT
1 read data i
9 8 2 side select o
13 12 3 gnd n.a
7 6 4 index i
14 5 drive 0 select + i
5 4 6 drive 1 select + i
7 gnd n.a
3 2 8 motor on o
1 9 direction o
10 step o
11 write data o
12 write gate o
13 track 00 i
14 write protect i
```

+ : On the 1040's external floppy interface, only the drive 0 select is active. It carries the actual drive 1 select signal. That way the external drive automatically becomes drive B.

The standard Shugart interface (again as seen from the rear) looks like this:

```
_____________________________________________________
////////////////////////////////////////////////////// <- Edge of
---------------------------------------------------- PCB
```

```
| 33 . . . . . . . . 1 |
| 34 . . . . . . . . 2 |
|----------------------|
```

```
PIN SIGNAL INPUT/OUTPUT PIN SIGNAL INPUT/OUTPUT
2 motor on 1 * i 18 direction i
4 in use * i 20 step i
6 drive select 3 * i 22 write data i
8 index o 24 write gate i
10 drive select 0 + i 26 track 00 o
12 drive select 1 + i 28 write protect o
14 motor on 2/ * i 30 read data o
drive select 2 32 side select i
16 motor on 0 i 34 ready * o
```

PIN 1-33 are all connected to ground (gnd).

*: Not used by the ST. +: Only one of these should be used. It might be jumper-configurable which is the active input.

C) Supply the drive with some power. I'm not sure if an 1040's internal supply can cope with two drives. However, since 3.5 inch drives have a low powerconsumption (my 1036A is rated at 1.8 W), a simple 5/12 volts powersupply shouldn't be so costly. The connections looks like this

```
________________________
////////////////////// <- Edge of PCB
------------------------
| ____|-----|____ | 1: +5 v dc
| O O O O | 2: GND
------------------- 3: GND
1 2 3 4 4: +12 v dc
```

D) Add cabinet to your taste.

There's a tiny fly in the ointment, however. (There had to be, right?) The VBL-interrupt routine in the ST, uses the status of the WRITEPROTECT-line from the drive to check if the disc has been ejected. Since the level of this signal is reflected in the statusregister of the floppydisc-controller, all the VBL-routine has to do is read the contents of this register from time to time. For this system to function, the drive has to toggle its WRPROT-line in some fashion (which i haven't bothered to figure out), whenever the disc is ejected. This represented no problem in my case, since the latest version (which was the one I used) of NEC FD1036A, is fully "ST-modified" and thus plug-in-and-go compatible. I bought my drive in W-Germany and payed around 220,- DM, which is VERY cheap by danish standards. (#include<standardcomplaint.tax> :-( ).

Well, I have to stop rambling. Let's hear more about homebrewed hardware-projects on this group. See you next time on the Newsshow.

```

From his first posting on this subject, I wondered why Mr. Meile brought it up at all. It's not like someone asked for a poll regarding the usefulness of multitasking. His "so there." comment seems to imply a certain degree of envy of the Amiga users who like to discuss (yes, and brag too) the merits of multitasking. At least, he appears to have a need to defend himself in some way about not having it.

I don't think anyone here would argue that multitasking is necessary. One doesn't NEED icons and desktop metaphors either. But advances such as these help make computers easier and more productive for non-power users. And multitasking is desirable from the systems development viewpoint as distributed processing, resource sharing, and other features become more sophisticated.

Personally, I'd like to commend and thank the members of comp.sys.amiga for not degenerating this topic to the "my computer is better than yours" syndrome that Mr. Meile seems to have wanted to provoke. We all like our particular computers or we wouldn't have purchased them: that's a given assumption. And we all have different factors for making our purchasing decision.

Do you realize, that this
whole conversation started out as, "can I multitask with a little memory",
and do you also realize that things like desk accessories, and carosels (sp?)
and the "multifinder", and the like all take up memory, and each process run
on a system with this "fake multitasking" will take up much more memory than
it would on a real multitasking machine. PERIOD. Because a machine (any machine)
is made with multitasking in mind, it is designed to make efficient use of it's
memory, and allows more processes to be run in a small space. That is why so
much memory is needed to use multifinder on the MAC.

>Well, the "power user" will tell you to buy a ferrari if you want to race
^^^^^^^^^^
WHAT the H*LL is a POWER USER, someone who can do more than one
thing at a time ??????
>
>>"The most important concept in modern operating systems is undoubtably

>book. Of course, if we followed the computer science model for home
>computers, we'd all be programming in ADA or Modula-2, and have degrees
>in math to boot. :-)
NO dave they weren't considering microcomputers, they were considering
operating systems, ALLLLLLLL operating systems. A computer is only as
good as the operating system available to the user!!! If you have a
SUPER-FAST computer that can do one thing at a time, and it can't even
do that efficiently because of the operating system, what good is it. WE
all have very fast machines (st, amiga, mac) and almost all of us USE
try to get the most out of our machines, multitasking helps us do that.
Also Do you agree, that Joe Average user, who doesn't know how computers
work, is always expecting them to work faster. As a consultant here at
the university, I ALWAYS seee begining users hit a key 7 or 8 times
because as soon as they hit it the first time it doesn't respond becuase

the VAX has 55 people on it...They are "POWER USERS" also, they want thier
power, they want Instantaneous replies, with an efficient operating system
they get them. (at least as fast as posible)

>and multi-tasking is an unecessary fribjob to accomplish that particular task.
>
>I leave my REAL work (which requires things like UNIX and VMS and TELNET and
>all of those neat things) at work.

BUT DAVE !!!!! I CAN do TELNET, on my amiga, WHILE I read text and
listen to Music Construction set playing Bach, and I soon will be able to
(hopefully) be running UNIX in a window on a 68020, while my 68000 is hacking
away at compiling the latest version of my Bugs :-), and doing the music stuff.
And the Reason I get most of my work done at home is because I can
dial into the school computer, make some changes in a program, compile it on
unix, and instead of doing external documentation on a project through the
1200 baud (yuck) phone line, I just flip screen around, and keep on doing it
right on the amiga, While the program is compiling. With a load of 45.00 on
a 785, it sometimes takes a while :-)
>
>-- Dave (I write stuff) Meile

Dave, When I first started using UNIX, the most fantastic thing for
me was the ability to just through some job in the background, and go about my
other business. I was no "POWER USER" just someone trying to get some work
done efficiently.

mike

I can't count how many non-technical types I've shown Amy and they have
no problem comprehending what multitasking can do for them if they are
given a few examples. Once the light goes on they tend to use it often.
Heck, I don't even need to show then Amy - 4 or 5 well chosen sentences
does the trick. Which is why I am really dissapointed (to put it mildly)
that C= has not run commercials that help people to see the light. That
should be easy to accomplish in a 60 second spot, maybe even in 30 seconds.
Peter's commercial idea with Big Blue, Mac, Amy, and the flunky was a
classical case in point.

Single-bit errors on DMA transfer.

If you have SH205 cables longer than eighteen inches they will not work reliably. If you have home-brew unshielded cables, or you have defeated the shielding (with a Y-cable), the same applies. [If your cables are longer than 18" and they came in the box with the SH205, let atari!neil know about it! And get them replaced.]

SCSI data transfers (at least on the ST) are not checksummed or otherwise validated. The DMA bus doesn't have much fail-safe, and you can run for a long time before noticing sporadic single-bit errors.

A simple test you can try is to read the same set of blocks over and over again (with Rwabs()) and compare consecutive reads; let it run overnight and see if you get any errors.

It's sad that the ST's only high-speed port is fraught with so much flakiness and folklore about its use. If there's a single piece of hardware Atari should improve on the ST, it's the reliability of the DMA bus. [Sorry, John.]

The ST's BIOS is re-entrant. GEMDOS is not. (I have a multiuser BBS system to prove it...) You just have to make sure that each task has its own BIOS register save area. That took me a while to figure out -- basically you switch the BIOS stack pointer in your task-switching routine, as well as the user stack pointer and all the registers. Multitasking on the ST is actually fairly trivial, as long as you don't try to use Pexec() or Pterm(). I'm working on rewriting both of those right now for the background Xmodem accessory in ST-Talk Professional.

Does multitasking have any advantage over TSR desk accessories, interrput controlled print spoolers, carousels of programs, etc? Of course. Ever try to write a TSR application? AARRGGHH! On the Amiga there must be a hundred different little clock programs, and how many of you can say you never use one of them? Same thing goes for screen blankers and terminal programs.

Sure, most of the time I'm doing only one thing. Or am I? The disk is working in the background, validating disk writes underneath other free time like when my application is waiting for it's next keypress or mouse move. That is a major hassle to program without multitasking; you wait for the disk to validate, or do without validation. That game I'm playing does vector calculations while the blitter is drawing vectors. Most of this advantage comes from hardware multitasking, but you use the same synchronization tools as you would for software multitasking, so it's nice to have them in the OS.

Whether your amiga program LOOKS like one thread of control or not, chances are pretty good that it's multitasking somewhere. It is far easier to write multitasking programs than it is to simulate multiple control thread programs on a single-tasking OS. This translates to the user as lower cost software that is available sooner, and a higher quality library of PD programs.

If multitasking is such a lose, why is Atari trying to do a unix workstation, along with Apple, IBM, Commodore, and everybody else? Why is OS/2 such a big noise? Why buy 386's? Get with the world.

Good for you, dude.

>Alright, thats it. For the last time, just because you dont want it/dont
>need it/can't understand it, don't for a second presuppose others
>dont want/need/understand multitasking.

He said that he didn't see any arguments why multitasking is a REQUIREMENT
for a microcomputer. Thinking it's useful, and liking it don't cut it.

>Open mouth, insert foot. Open hand, take egg. Apply to face.

Do you do that often? Perhaps you should seek therapy.

>P.S. This is not a flame. This is not even a spark. If you would
>like flames, I'll be glad to lay into you, you little jerk.
It sure sounds like a flame to me. I'm not going to claim what I'm doing
isn't. Why don't you crawl back under the rock from whence you came?

Why can't people just forget this stupid argument? I bought my Atari because it does what I wanted at the time, you bought your Amiga for the same reason. Why can't you just leave it at that? When I bought my ST, the Amiga was at least $600-$700 more expensive than the ST. I didn't have that extra money. If I had, maybe I would have bought an Amiga. Maybe not.

I don't need this damned "my computer is better than yours because mine does x, nyah nyah nyah" bullshit.

842. the real advantage of multi-tasking.

Newsgroup: comp.sys.atari.st
Date: 1987-12-23 20:56:39 UTC
From: jack@cwi.nl
Message-ID: <153@piring.cwi.nl>
Source record: 255393

Lots of people say things like 'I don't need real multi-tasking,
I'm happy with a spooler and one or two other utilities'.

The point, however, is that applications like spoolers become
completely trivial once you have multi-tasking. 90% of the code
(and the most error-prone 90%, at that) is spent stealing vectors,
jumping in and out of supervisory mode, making sure your program
isn't overwritten by something else, etc etc etc.

I've been working on a network where a number of atari's can use
each others disks, but things got so incredibly hairy that I've
suspended the project and started thinking about making the BIOS
(or maybe even GEMDOS) multiprogrammed first. This will make my
remote-disk almost as trivial as a ramdisk.....

>> they just need faster integrated compilers, though :)
>>
>> Robert Gardner
>>
Here's a real-world example. Note that this is from the
programmer's perspective, not the user's. As you will see later, this is
irrelevant.

The specifications are as follows: You are to design a space
invaders-type game. There is one spaceship at the top of the screen, and a
gun at the bottom. The spaceship moves across the top of the screen from
left to right; as it does so, it "drops" letters forming words down the
screen.

As the user types on the keyboard, the program checks to see if the
letter typed matches the one the gun is currently under. If so, the letter
is shot and the gun moves one position to the right (to the next letter in
the word. If they don't match, a short error signal is delivered to the
user.

The screen will look like this:

```
------------------------------------------------------------------------------

...<-=O=->

S P A C E W E L L C R A

T H A N T H I S H A L L K I L L T H R I L L L A K E G R E A T

A N P A R T D R A T S P A C E B E A T H E A R S E A D R E A

A T H E R M A P T H A N F O R H E A R T

|
A
/#\
------------------------------------------------------------------------------
```

The spaceship moves across the top of the screen at a fixed rate.
When it reaches the end of the row, all the rows drop down one, and the
ship returns to the left side.

To make it more interesting, a range of colors in the spaceship are
to be cycled, to make it look like it's spinning. The cycle rate is totally
independent of any other regular rate in the program.

Don't worry about winning or losing at this point; they'll
complicate the issue.

Now. Design this program, first on a system with multitasking,
and then on a system without it. Discuss the design issues that need to be
considered, and how you would address them under each environment. "Be
specific; give examples."

Whether or not the machine multitasks should be made invisible to
the user; both versions should run the same as far as the user is
concerened.

I designed this very program on the Amiga. I was porting the
program from the Atari ST, working from the ST source code. Before posting
my approach and ultimate solution to the problem, I want to see how others
would address it.

That is, if anyone cares.....

[In the article titled "Re: Multi-tasking? A nightmare...", Dec 22, 1987,

Before my mailbox overflows:

There is a program in place for Abaq developers. In the USA, you can get information on what documentation will be available, and a more complete look at the Abaq itself, from Atari. In the UK you should go right to Perihelion.

To get the information package, write to:

Atari Corp.
1196 Borregas Ave.
Sunnyvale, CA 94086
Attn: Cindy Claveran

To become a registered developer of the Abaq, you can get the documentation package and get news of when developer units will be available. The cost is $100, sent to the same person listed above.

The major difference between carouselling (I love that term) and true multitasking is efficiency. You alluded to these above however the conditions where this is a win are greater than just the compile/edit cycle mentioned. Basically you keep the CPU busy and get more work done.

The other advantage to true multitasking is the transparency of it. When you program this becomes self evident. No special steps are needed to run two tasks simultaneously, and flexibility is enhanced. A really nice example is Carolyn's Pallete Tool. This runs as a separate task and can be run with any other program to provide a color adjuster. Plus you don't have to go through hoops/special startup sequences etc like you do with DAs. It doesn't make it better, it demonstrably makes it more efficient over the long term.

Anyway, it is a hell of a lot easier to not use than it is to simulate when it isn't built in. My whole case on 'picking a computer' is based on what it *can* do versus what it was *designed* to do.

Simply put, rating two computers can be done rationally.

If any program that can be written on computer A, can be identically duplicated on computer B. And, a program can be written on computer B that *cannot* be identically duplicated on computer A. Then, computer B can be said to be *more capable* than computer A.

If any program that can be written on computer A, can be identically duplicated on computer B. And, the program on computer B is consistently faster than computer A. Then, computer B can be said to be *more powerful* than computer A.

If any program can be written for computer A, that computer B cannot duplicate, and any program can be written for computer B that computer A cannot duplicate. Then these two computers can only be compared while specifying the limits of the comparison.

Once again, I would like to see a comp.sys.compare newsgroup.

Another aspect in the debate over multitasking comes to mind. A few weeks ago some guy was hawking his book on a talk show...don't recall the author or the title but it was pretty much the antithesis of the "Micro Millenium" that came out a few years back.
His theme on the show was that office automation most often _reduces_ the office productivity (I've seen this phenomenon mentioned in Infoworld and elsewhere so I'll assume there's some truth to it). So managers will be forced to either toss a lot of the techno-glitz and hope productivity improves, OR employ `watchdog' software to see that everybody is meeting quotas and not goofing off...he called that the `electronic sweatshop' approach. The argument went like this:
Right now, PCs are still pretty slow. There is time for employees to get away from the machine for a few minutes while it calculates, sorts, or whatever. But the new generation of PCs can do several things at once, so instead of a moment's relaxation the employee will just move on to a new task. And employers will have the ability to see that they do just that.

I've heard that such monitoring is being used a little already for cashiers and ticket agents.

Personally, when I first used multitasking systems I thought it was great, and did a lot of simultaneous compiles and whatnot. But these days I rarely try it...seems there's always paperwork to do and journals to read while the computer is busy, so I mentally multitask. Getting the eyes off the screen (*&?!! VT-compatibles) reduces headaches too. After stopping to think about it, I don't know that I'd walk across the street to pick up a multitasking os. Kinda like quadraphonic sound...cute concept but I wouldn't pay extra for it.
Having used up a week's worth of computer blasphemy in this message, I'll quit.
Notes:
1) No, I didn't post to Amiga. I've lost what interest I had in that machine.
2) If you've sent me mail in the last month (or two?), I haven't been keeping up with it. I'm clearing up the backlog and hope to be caught up shortly... sorry.

848. Multi-tasking on micro computers

Newsgroup: comp.sys.atari.st
Date: 1987-12-24 03:28:29 UTC

Dave,

I totally agree with your statement:

"BUT I still insist that, for the non "power user" there's no need for it."

The problem is that most computer users these days, are power users. The children running games don't need "high power or multitasking" - nor do people who really don't understand what a computer can do for them. Once someone reaches the point where they really understand what a computer can do, they should be given access to all the power they need or want to complete the required task - multitasking is just another tool they might need to complete that task.

The truth of the matter (bickering aside) is that there are useful things a true computer user or programmer can accomplish with multitasking that can make his/her life easier. (btw: I don't own a multitasking machine - but I do have a Sun 3/50 on my desk at work - and love it!).

All these flames about what machine is "better" are total trash. Every machine, ever created, is good for "SOME" task - not every task. The truth is that some tasks can be more easily done and/or done more efficiently with multitasking.

If you really want an example OK: Say you are running a mail server on your machine - you would still want to be able to do anything you normally do (editing, debugging, etc) while the mail server is running... For that, you NEED multitasking.

To make small computers able to do complex tasks - multitasking is required. Multitasking is just another tool -- like more memory, RAM disks, disk storage space, tape backup devices, sidecars, magic sacs, etc., etc. To most computer professionals, multitasking is just another tool you use to complete a task - it is a fact of computing life.

Unfortunately, even if you adhere completely to the standard, half the devices in the world still won't talk to you without a breakout-box or cable switching. When the only devices extant were computers and terminals, that was no big deal, but tell me, how about hooking up a terminal concentrator/network node to printers, computers, terminals, ... We're talking BIG-time troubles here, we're talking about cabling nightmares to end all nightmares, even if the standard IS followed (and it usually isn't -- e.g. a switcher which arbitrarily decides to ignore an outgoing line if certain transitions don't occure at certain times, and a network node which refuses to give the switcher those transitions -- thus FUbaring things horribly.).

I hated having to mutilate my cable to flop RxD and TxD when I hooked up an Amiga to a C-64 to transfer files at 9600 baud (yes, there's some magic involved :-).

850. Even more thoughts about multi-tasking.....

Newsgroup: comp.sys.atari.st
Date: 1987-12-24 06:22:00 UTC
From: gjwelych@SUNRISE.ACS.SYR.EDU
Message-ID: <8712240738.AA01731@ucbvax.Berkeley.EDU>
Source record: 255401

I just sat here reading my Info-Atari16 mail and read about 20 replies,
and counter-replies. All on the subject of multi-tasking.

I think that the issue is NOT joe-average-user being too dumb to use
a multi-tasking environment, but that they don't have a NEED to as of yet.
To whom ever said that Joe-Average-user is NEVER going to need multi-tasking,
have you ever look at the future prospects??? Maybe they don't need or
want to use it now (or even know HOW to), in the future, it may be
NEEDED by ANY user of a computer. I think the MAIN reason multi-tasking
personal computers are not extremely popular, is due to the LACK of
them on the market. Yes, I know there are some on the market now, but
five years ago, name one! (note I said personal computer and not mini's or
super micros) This lack of public use (and abuse) of multi-tasking is
why joe-average-user doesn't feel a NEED for it.

As a side note, only the recent emergence of high-resolution graphic
displays have made using a multi-tasking operating system easy enough
for non-hacker types. Currently, I rarely use the multi-tasking abilities
of the VAX I'm using now. The reason is NOT that I have no need or ability
to use it, but that it is VERY difficult to use easily. And due to the lack
of EASE-OF-USE, I haven't tried to use it to it's fullest extent where
I currently sit saying, "It sure would be nice to be doing such-and-such
while I'm doing so-and-so!". If the VAX had a nice, inexpensive, easily
gotten, and logical graphic interface, I know I would be using the
multi-tasking to the hilt!

I see a day when EVERY computer had better have a multi-tasking operating
system. The express need will stem from the, as of yet, unexplored uses
of computers in normal human existence.

I doubt many people feel the way I do, but at least to me, these are the
reasons I will NEVER get another computer with-out a multi-tasking,
graphic environment.

Please note: The above is NOT a flame to anyone, about anything, or even
just for the fun of it. It is just the expression of my
thoughts on the subject.

Just a thought,
Greg Welych.

PS: Please, people, let's not start ANOTHER "My computer is better than yours"
war. I have had enough of them.

Please, could we turn down the flames a bit.

On the systems that don't have multi-tasking, such as the IBM PC and the Mac, we observe people desperately fighting the operating system to get some concurrent operations going. Terminate-and-stay-resident programs, such as Sidekick on IBM PCs, were an attempt to get around the lack of multi-tasking. The attempt was only moderately successful, and such programs often interfere with each other and the program they preempt. Microsoft takes the position that such programs violate the rules of MS-DOS and has warned for years that they will not work under future versions of MS-DOS. They won't work under OS/2, but OS/2 offers multi-tasking, so they will not be needed.

PC spooling programs, which must patch into interrupt locations and store into the operating system, have similar problems. (Try to get a printer spooler and a plotter spooler both running at the same time.) Even desk accessories on the Mac, which are officially supported by the operating system, are something of a kludge internally.

So what we see, on the systems that don't offer multitasking, are attempts to achieve it through hacks that don't work too well.

> I think that these arguments aren't representative of an *average* user,
> since an average user is more likely not to own a modem.

Oh, I don't know about that. Our Amiga club did a survey of its users, who would probably fit into most people's idea of "normal" users, and over 80% of them had modems. Granted, most of them used the modem for bbsing, but that is certainly an environment in which one could use multi-process capability, be it true multitasking or simply context switching. Amazingly enough, the RS Color Computer Club I formerly belonged to had a much-much lower percentage of modem users (on the order of around 20% if I remember correctly). Perhaps it is too much of a hassel to do a days work one step at a time?
I wouldn't consider myself a "normal" user either, but something I have found quite handy is the ability to have a directory showing up on one page while trying to reorganize it on another.

PROBLEMS WITH MY DISKDRIVE

Lately I have been experiencing some problems with
my diskdrive on my ST (1040). When the machine has been running some
time and I write something to my disk (or read something from it)
it will keep on spinning (red light also remains on). It seems to be
due to the heating of some part, since it does not happen when the machine
is cold (boots). A warm boot exstinguishes the light for a moment,
bit does not solve the problem.
Has anyone had similar experiences with his ATARI, and if so what
was the solution?
Any comments are appreciated.

I agree with Mr. Storin's main point fully, and moreover think that Joe Average will, unless he's very careful, actually *learn* something about what his computer can do and take advantage of multitasking eventually, but--I think that a visit to a friend or neighbor with a CoCo 3 running OS-9 will show that one can have multitasking on an 8-bit machine. (Much less a visit to a place with a dozen folks hacking merrily away on a Gimix 6809-based computer.)

858. A defense of Multi-tasking

Newsgroup: comp.sys.atari.st
Date: 1987-12-24 16:12:13 UTC
From: denbeste@bbn.COM
Message-ID: <5595@cc5.bbn.COM>
Source record: 255409

The original poster of this subject asked if there was a place where multi-tasking was "essential". Many people responded with ways to use multi-tasking, and the original poster always responded with one of two answers:

1. There are other ways to do that that don't involve multi-tasking. Multi-tasking therefore isn't essential for that task.
2. Only sophisticated users would want to do that. (He called them "Power users.)

[Well, actually, there was a third answer used a couple of times:
3. Why are you being so abusive in a publicly posted article? Why didn't you mail it to me so I could ignore it?
But that's not relevant to the subject...]

Let's get one thing straight. Multi-tasking is not "essential".

Neither are high-level languages. You can do anything in assembly language you can do in C or BASIC, but it is less convenient. (MUCH less convenient.)

Nor are icons. People survived for years with text-only computer interfaces.

[For that matter, assemblers aren't "essential" either - you can key in machine language directly in hex. And if you really want to get down to it, the computer itself isn't "essential".]

I'm not suggesting that multi-tasking is as important as high level languages. That's not the point. I _am_ saying that requiring a feature to be "essential" to be included is a ridiculous criterion. The proper criteria are "useful" and "convenient".

On the Mac, there are many programs which can run simultaneously. To do this, however, they must be written in a very special way and the operating system must be specifically informed of each.

This is certainly an approach, and it seems to work for the Mac owners. There are certain special cases on the ST, I am sure, where more than one thing can happen at the same time (like a print spooler, for instance) - again it is done specially.

On a general purpose multi-tasker, ANY two programs can run simultaneously, unless one of them is being a particularly bad citizen. Though this isn't "essential", isn't that more convenient?

Which brings us to the second argument: Even if multi-tasking is indeed useful and convenient, it still won't be used by the great unwashed (called typical users in the original posting). Only "power users" would use it.

I don't quite understand why that means a feature should be omitted. Is it being suggested that a feature should only be included in a product if EVERY OWNER of that product will use it?

More importantly, it assumes that the users won't mature and become more sophisticated. Though a user may not use a feature when the product is first purchased, many times the user will grow into it as time progresses. "Power users" all began as unsophisticated users.

However, they won't mature if the machine they are on won't let them. I used to know quite a few owners of TRS Model I's, who were wizard Basic programmers, but were so restricted otherwise by the machine, that they might now never grow out of it, even if now given a better system.

In many ways, it is desirable that a machine provide some advanced features that the new user won't immediately use, so as to provide room for maturation and learning...

...providing it is done so that the user isn't forced to use this feature before ready.

Which leads me to the last point: The original poster stated, but never justified, a belief that providing multi-tasking was not merely useless but actually undesirable. I don't see it.

If:
1. Multi-tasking doesn't add to the purchase price of the product
2. It isn't intrusive on people who don't understand or need it right now
3. It is available for those who do understand it, or those who grow into it

Then
I state that it is an unmixed asset and should be in the product. I would be very interested in hearing why, given these three assumptions, multi-tasking should be omitted from a product.

If you change any of the assumptions, then you are arguing against a strawman. All three of them are true for multi-tasking on the Amiga.

If you say "There are other ways" that is irrelevant. The point is not to show alternatives, but to actually demonstrate that multi-tasking is a negative thing in its own right.

If you cannot demonstrate that it is an actual danger, then it is merely useless for most (but not all!) users. But since, by the assumptions, it doesn't impede those users who don't use it, then its ability to attract "power users" makes it an asset. (It attracted me - it is the main reason I bought the Amiga.) (By the way, by so doing it represents an indirect asset for those unsophisticated users, because the "power users" are cranking out public domain software which the unsophisticated users can get for free. 120 880K Fish-disks at last count.)

We therefore have three classes of users for the multi-tasking machine:

1. Those who don't understand and won't use multi-tasking, but are not impeded by it. [If you think they are impeded, then we are out of the realm of the theory and into fact. I state as a fact that it does not impede rank amateurs on the Amiga.]

2. Those who don't understand it to begin with, but grow into it.

3. Those who understand it and use it from the very beginning.

Group 1 isn't bothered by its presence. Group 2 and Group 3 benefit by it. How can it be a bad thing?

Which brings us finally to the issue of the motive of the original poster. Let's try some syllogisms, shall we?

1. The Atari ST is an ideal computer
2. The Atari ST doesn't have multi-tasking
ERGO Ideal computers don't require multi-tasking.

1. If several machines offer multi-tasking, people will grow to expect it.
2. If people grow to expect it, they will refuse to buy machines not having it.
ERGO If several machines offer multi-tasking, the public will refuse to buy machines not having it.

1. If several machines offer multi-tasking, the public will refuse to buy machines not having multi-tasking.
2. The Atari ST doesn't have multi-tasking.
ERGO If several machines offer multi-tasking, Atari ST sales will suffer.

1. Anything which causes Atari ST sales to suffer is dangerous.
2. If several machines offer multi-tasking, Atari ST sales will suffer.
ERGO It is dangerous for other machines to offer multi-tasking.

Could these be the real reasons behind the original posting? Or maybe just a deliberate attempt to stir up trouble?

Most PEOPLE don't multitask on a computer, they task-switch.

HOWEVER! Having multitasking available allows one to write (and use)
programs that multitask internally - sending messages back and forth
to each other, processing things concurrently rather than serially.
Many nice programs on multi-tasking machines just aren't possible on
any single-tasking machine because they INTERNALLY take advantage of
the machine's ability to multi-task and message-pass. Examples on
request, by E-mail.

As a user, MultiFinder is all I want, in most cases. But now that I
know what's possible for a -program- (not -human-) to do with a
multi-tasking machine, I wouldn't want to use a task-switching machine.

A few years from now we'll be arguing about something else, since
everything will multi-task or parallel-process anyway.

Agreed...even my worst case program (hdscan) takes less than a minute to compile, so I rarely even have the urge to pop it into the background...

> ... And yes, I know that background print spooler gadgets can
>run on single task DOS's ... I've seen 'em in CP/M, RT-11, Mess-DOS,
>and many many others. But I've never been convinced that they
>ever ran cleanly.

???Why not??? I have less trouble with the automatic print spoolers on my PC clone and ST than I do on the Unix boxes at work. I can prioritize jobs, edit stuff in the queue, etc on the ST version, but those hacks are mostly fluff and rarely used...besides, I have seen those handy little standalone print spoolers going for under $50 nowadays, so that may be a better solution in the long run...

>I'm thinking ahead some time into the future when we'll have
>ISDN running everywhere ... In order to handle network communications
>cleanly we'll need to have multi-tasking.

Umm, by the time we have ISDN running everywhere, our current computers will probably be dust. By then, most of us will probably be running some variant of Unix on our machines if we want to properly utilize ISDN (i.e. we will have BIG drives, some form of USENET access ...which I can't quite picture even two years from now, since we are running about 28MBytes of messages/week now..., very high speed modems, etc.)

>[There are] also things like mail daemons
>and such that recieve e-mail while you're asleep (or away
>or whatever).

UUPC seems to work fine on the ST and I have several STadel (ST citadel) boards that poll my Unix box every couple of hours for uucp mail and the comp.sys.atari.st sections. I am sure there are a lot of

Amiga systems doing the same (I recall that UUPC came out for the Amiga and Citadel is also running on the Amiga).

>For right now? Well, how about killing run-away processes?

On the ST OS-9 or the Multi-tasking C shell has the standard ability to do this...And on the Amiga or the ST, you can always hit reset to kill everything, but still keep the things that were out on RAM drives...(I used this feature a lot on both the Amiga and the ST in the early days of using C compilers that were released too soon.)

I agree somewhat with Dave Meile on this discussion/argument. In the long run, the average user of a popular computer is not the 'BBS'-type or a person that needs anything more than a few utilities in the form of desk accessories on top of an application. Unfortunately, the IBM PC and the Mac have gained the 'average' user market, to date. Those of us with Amiga's and Atari ST's are either technical enough to appreciate and use the special features of the respective computer, or we had very, very persuasive friends who convinced us that the Amiga/ST was the best computer. The 'average' user is still the person that just buys a Mac or PC for a very specific purpose (usually for writing memos or doing spreadsheets in a business environment). They may run Lightning/Thunder (real time spelling checkers on the PC/ST) in a pseudo background manner, and have a ton of desk accessories or pop up tools, but they rarely go in for the increased complexity that a multi-tasking environment like DesqView offers on the PC. Even the carrousel approach (there, I just multi-tasked and asked my wife for a spelling check...it can also be spelled carousel) is somewhat confusing to people, but I have seen secretaries fall in love with the carrousel programs on the Mac and the ST...although not on the PC version for some reason.

The problem you have with holding down the alt-ctrl-shift may have to do with WHEN you hold down the keys. If you bootup with! the keys down, then it will not work with the new ROMs.
Try turning on the machine (or resetting) wait a second, then hold down the keys. This should work.
Don't use GEMBOOT with th[e new ROMs, use foldrxxx.prg instead.

Also, I had the same[problem with the message about a non-supported ROM version. Ignore the message, the driver is actually installed, and works just fine.

From article <945@ssc.UUCP>, by fyl@ssc.UUCP (Phil Hughes):
>
> I have tme BMS controller. It works fine (once we found the bugs but
> that was almost a year ago). The only question I have about it is does
> it actually cost less. You need to buy the interface and controller
> ($250, I think), then get a drive, box and power supply.
> No problems putting it together but when you are done you probably
> could have bought a Supra or Atari drive.
> --
> Phil Hughes, SSC, Inc. P.O. Box 55549, Seattle, WA 98155 (206)FOR-UNIX
> uw-beaver!tikal!ssc!fyl or uunet!pilchuck!ssc!fyl or attmail!ssc!fyl

agreeded, I alway felt the advantages of the BMS solution were:

1. It came with a battery backed-up real time clock

2. It supports two hard disks on the same controller

3. If and when i wanted to upgrade to a larger disk, i just unplugged
the old one and plugged the new one in

as to cost, be creative, most cities support at least one good used
electronic surplus/salvage store

864. Re: Atari's Marketing Approach

Newsgroup: comp.sys.atari.st
Date: 1987-12-24 18:23:44 UTC
From: uace0@uhnix2.UUCP
Message-ID: <481@uhnix2.UUCP>
Source record: 255415

Okay, how can you change Atari's image? Does it matter? Sure, more advertise-
ments would be nice, but what benefit do we, the curreniet owners of STs derive
from that? Perhaps it would be a boost to our own egos having more commmercials
on TV. I mean who wants to own a machine that doesn't receive alot of press?
In actuality, I doubt that more TV advertising would do too much good, other
than allowing us to say "I saw the ad five times in one hour," or "Did you
see the ads last night?"

Ask yourself this - how many other computer companies make game machines?
Answer - NONE!
Not Apple, not IBM, not Commodore, no one.
Therefore, Atari is stuck, because they do currently sell game machines.

This is not neccessarily bad, but more advertising, I beleive will only give
us current owners a shot in the arm. Remembere, actions speak louder than
words, and no advertising can boost sales if you don't have an exciting line
of products to sell, and new products on the way. If Atari can produce, then
they zwill be successful. The ABAQ is exciting, but may come out too late to
'steal' the show. Is it important for Atari to come out with products first?
For us owners, we certainly would take a lot of pride in the company if we
were owners of a$ computer from a company that was 'on the leading edge' and
delivered prroducts before anyone else, but what real benefit do we get from
that other than feeding our egos.
So, before you go complaing to Neil, ask who will really benefit. Is this
'commercial wars.' Are we feeling left out? We have a good machine that is
exactl[y what we paid for. What more do you want?

Flame me at this address, if you want. I just get tired of complaining about
immaterial things. If you wanna complain, complain about how GEM is a closed
operating system that must be hacked at to figure out (that's GEM, not TOS).

My opinions are my own, and do not neccessarily reflect our users' group,
company, university, or any living being.

>Oh, whoops! I didn't really mean that! I was trying to imply that
>RS-232 is more of a general protocol that you'd want on a computer,
>where MIDI is specialized so that it can only be used for music. If

Just to add further confusion to this discussion...
I'm pretty sure that EIA RS-232c is just a hardware spec, eg., voltage
swing, line assignments, line loading, maximum line length, etc.
I don't believe there's anything in the spec about transmission protocols,
but I admit that the term RS-232 seems to have taken on a broader
colloquial meaning.

Well, the bad way is to use Publishing Partner. It works unless
PP screws it up (which does happen). I have used this method (it is
how I got the graphics into our new UNIX products catalog) but would
like to have a cleaner way.

>
> -- Dave Meile

I normally avoid religious wars, but this is too much. Just who are
these mythical "non-power-users" that don't need multi-tasking. Everyone
is trying to convince you that they don't exist. I'll tell you what.
You show joe user what muti-tasking can do and then tell him that he is
too unsophisticated to use it. Then duck. Manufacturers who underestimate
buyers go out of business. If "joe user" couldn't use multi-tasking, we
would not have kludgo simulations (TSR's, desk accessories, etc.). As one
of my co-workers posted, it is only a matter of education. Joe user expects
magic from a computer. As soon as he realizes a computer can't do two things
at once, like he can, he'll be unhappy. He wants multi-tasking.

And I'm not picking a bone for the Amiga over the Atari. Note my employer.
We only support one of those two machines. And its not the Amiga.

Sorry, no cute signature file.

872. A different view on multitasking.

Newsgroup: comp.sys.atari.st
Date: 1987-12-24 22:25:29 UTC
From: SARGON@UMass.BITNET
Message-ID: <8712241627375A7.AJJY@Mars.UCC.UMass.EDU>
Source record: 255422

In light of the humorous (if not entirely short sighted) notes on the usefulness of multitasking to the "average" microcomputer user I thought Id toss in some historically relevant views..

1. A microcomputer user will never need anything more than a few cassette tapes to hold his work.

2. A microcomputer user will never need anything but a TV set to display information from a computer.

3. A microcomputer user will never need even as much as 64K of memory.

4. A microcomputer user will never need a language other than interpretive BASIC to perform any task.

Last time I heard the Atari 1040ST came with an 800K floppy disk drive, requires a monitor (as Atari didnt put the modulator in there), comes stock with 1MB of RAM and doesnt come stock with BASIC. Does this make the designers at Atari morons for putting in such useless junk? I think not.

Finally, your "average" user of a modern microcomputer (this gets rid of the Apple II and C64 crowds) is more likely to be in a business or higher education setting than in the kitchen as a $x000 recipie file. Both of these areas are demanding the ability to share and distribute information. This means networks. Networks need software drivers that requires a certain degree of multitasking. Im sure Atari the self proclaimed "vertically integrated" computer maker will be (or hopefully IS) working on both multitasking and networking. The 286/386 and the 030 all have memory management hardware whether you use it or not. Why not use it?

873. spectrum 512, MWC, BDT MT C-shell, Alpaha Mega Disk(?)

Newsgroup: comp.sys.atari.st
Date: 1987-12-25 00:18:00 UTC
From: bryan@nyit.UUCP
Message-ID: <251@nyit.UUCP>
Source record: 255423

I only had my 1040ST for a week before the drive went and I'm still
waiting for it to come back so in the meantime I thought I'd ask a few
questions.

I've been reading about Spectrum 512 in Antics START magazine and was wondering
if anyone has disassembled the code and found out how they put 48 colors per
scan line? Does this code work for putting more colors per scan line
in medium rez? Also could anyone out there who owns Spectrum 512 tell me how
like/dislike this product?

I plan on buying it just for the feature of 512 colors but I was just wondering
how good a paint program this is compared to Degas & NeoChrome.

About how they do it, Spectrum owns the rights to Spectrum 512 not the ability
to put 48 colors per scan line. I feel Spectrum has done something that I
didn't think was possible and they deserve all the customers they can get, it's
just that I hope the how's and why's of the scan line trick become public
knowledge, for a person shouldn't have to buy the program just to be able to
have 48 colors per scan line on their ST's.

I'm currently using Mark Williams C with Beckemeyers MT C-shell and together
they make a pretty powerful programming environment. I was wondering if anyone
knows how much temp space both programs use? I set a ramdisk up and put the
most used commands from MT C-shell into it (ls, cd etc.) and was wondering how
much bigger I should make the ramdisk to hold the /tmp area which MWC & BDT
MT C-shell use for temporary storage.

Also while talking about ramdisks has anyone bought the Mega disk(?) by Alpha.
It's suppose to be a 1 meg. ram cartridge which plugs into the cartrige port
on the Atari and gives you the ability to have an 800k ramdisk + 200k printer
spooler or two 400k ramdisks and the printer spooler. Also included for $299 is
a power supply so that after you turn your computer off your data is still
intact, sort of like a mini Hard Drive. For the price it sounds good, if
anyone has bought one could you tell me how you like it and also how could
I get MT C-shell to recognize the 200k printer spooler?

Thanks in advance

Merry Christmas & Happy Holidays to all

I'm glad to see that someone else has discovered this gem of a machine. Around
this neck of the woods (New York) it seems to be selling well and users marvel
at the power, quality and accessories of a printer that sells for a relatively
meager $350 to $400. I've used several drivers and wound up with a variety of
screen dump sizes but all high quality. Speaking of high quality, if you're
into Desktop Publishing this machine will make you think twice about spending
all that money on a laser printer.

>I'm looking for a CP/M - Z80 emulator that will run on a 680x0-based
>computer. Please email if you know of such a beast. Thx.

There is a very nice PD one for the ST...If I remember right, the docs
for it seemed to indicate that the original 'port' source would work
on any 68000 computer (it has been over a year since I played with
it, so the name of the company that wrote it escapes me). Atari did
put this out as a PD disk, so maybe Neil can help? If not, I'm sure
you could get the disk from your local Atari club...

I recall getting about 1.5MHz to 3Mz throughput on most of the
programs I had from the ATR8000 days...things like Perfect Writer,
Wordstar, Turbo Pascal, etc all worked fine. I even used some of my
wifes software that I copied over from her Geneva portable and it
ran fine (but emulating a 80 char by 8 line display).

One point that has been a bit overlooked by the Desk Accessory/Pop-Up Utility crowd -- why be forced to "make do" with the limitations that a Desk Accessory imposes? NOT to suggest that the Desk Accessory are not useful, or that the programming done by their authors is somehow lacking; what I DO mean is that in a multi-tasking environment I have my CHOICE of any number of full featured programs, all of which run together (within the limits of my systems resources, of course.) So I can use the same word processor and outline processor and spreadsheet and etc. that I always use, rather than one that can run as a Desk Accessory (and thus is used mainly for just that reason.)

This message contains the latest info-atari instructions to subscribers. Please go through it (even seasoned users!) and retain for future reference. Of special interest to BITNET users (and interent users with access to bitnet) is a section on accessing the 16-bit program libraries at the Univ of Houston.

The info-atari moderators.

Welcome To Info-Atari.

1. Sending Messages

You may send messages to all "subscribers" by address-ing it to

info-atari8@score.stanford.edu

and/or

info-atari16@score.stanford.edu

Administrative messages should be sent to

info-atari{8,16}-request.

Please do NOT send general messages to this address. Your moderators get enough mail as it is!

2. Ground Rules

All messages should be in good taste. Commercial mes-sages and advertisements are not permitted. When answering a question, please consider carefully whether the answer should go to the whole list, or just to the person who asked the question.

The following ground rules should make the use of this (or of any other) mailing list much easier:

* never send a message that a totally irrelevant to the mailing list's purpose to a mailing list. This espe-cially includes any expressions of irritation at another list member.

* never forward a message that is totally irrelevant to the mailing list's purpose to a mailing list.

* when replying to a message on a mailing list, reply only to the sender of the message unless the reply is of interest to the entire mailing list.

* avoid inserting the message being replied to in a reply, especially in a message going to a mailing list. The context of the reply should be clear from *your* reply and from various mailer functionalities such as Message-ID.

* when replying to an earlier reply that violates the previous rule, ABSOLUTELY DO NOT make matters worse by adding your own violation.

December 25, 1987

3. Archives

Archives are kept in several places in formats available to everyone. As described below, if you are on ARPANET/DDN you will probably find it more convenient to retrieve files from the archive on radc-softvax.arpa using FTP. If you are not on ARPANET/DDN, or are unable to use FTP, you will be able to retrieve files from archives distributed over several Bitnet hosts by sending mail (notes) to a program called LISTSERV.

3.1. Archives on radc-softvax.arpa

Files from radc-softvax.arpa are available by FTP. FTP will work only for hosts directly connected to ARPANET/DDN. Please obtain local documentation and advice for the FTP user programming running on your host. There are two directories under the anonymous account. One for atari8 and one for atari16.

FTP to radc-softvax using login:guest and password:guest. To get the current list of available atari16 files do a 'get atari16/files.doc'. All of the atari16 files are stored in the atari16 subdirectory. If you need any other information, contact Marc Poulin.

The archive is maintained by Rodney Peck (Peck@radc-multics.arpa) and Marc Poulin (Poulin@radc-multics.arpa or Archives@radc-softvax.arpa).

3.2. LISTSERV

LISTSERV provides access to files for everyone who can send mail, independent of their location. Note, however, that intermediate notes have been known to refuse to handle long messages or have damaged them in transit. LISTSERV provides a number of features which you can access by send-

ing mail (note) to LISTSERV. Only the barest minimum are described herein. On Bitnet messages should be sent to your nearest LISTSERV (the one from which you receive the info-atari digests). (If your address is not on Bitnet, an address for file servers is given below.) All mail sent to LISTSERV contains command lines. LISTSERV will respond by return mail. No subject is necessary in such mail. For more information send the command

INFO

3.2.1. List Names

The list_name for 16-bit Ataris is INFO-A16. The list_name for 8-bit Ataris is INFO-A8. These list names are used by Bitnet addressees for subscribing and unsubscribing

and by everyone for obtaining back copies of news digests. The list_names for programs stored in the archives are PROG-A16 and PROG-A8.

3.2.2. (Un)Subscribing

If you are on Bitnet you may add or remove yourself from the distribution list. It would greatly convenience the moderators if you would do so when you no longer wish to receive digests.

The command to join the list is

SUBSCRIBE list_name User_name

The command to remove yourself from the list is

UNSUBSCRIBE list_name

It would be most convenient if users took care of their own subscribing and unsubscribing, but messages to INFO-ATARI-REQUEST{8,16}@SCORE.STANFORD.EDU will still be accepted.

3.2.3. Accessing Program & Digest Archives

All digests are in the archives. There is a separate program library. You can obtain copies of files from LIST-SERV by sending a message in the specified format.

If you are on ARPAnet (or gatewayed to it), your mail concerning 16-bit Atari information should be addressed to

LISTSERV%CANADA01.BITNET@CUNYVM.CUNY.EDU

Mail concerning 8-bit Atari information should be addressed to

LISTSERV%TCSVM.BITNET@CUNYVM.CUNY.EDU

To obtain a list of files in the file server, the command is

INDEX list_name

The command to obtain a specific file is

GET list_name file_name

for example,

GET INFO-A16 87-00076

December 25, 1987

- 4 -

If you want to learn more, send the message

HELP

The moderator of the 8-bit program library is John R. Dunning. This library is not yet available for use, and further information will be posted to both newsgroups as it becomes available.

3.2.4. LISTSERV Moderators

The person to contact if you are having problems (un)subscribing is Harry Williams (harry@marist.bitnet). The moderator of the 16-bit digest archives is Peter Jasper-Fayer (sofpjf@uoguelph.bitnet). The moderator of the 16-bit program archives is Richard Werezak (carson@mcmaster.bitnet). The moderator of the 8-bit archives is John Voigt (sysbjav@tcsvm.bitnet). The moderator of the 8-bit program archives is Arnold de Leon (adeleon@hmcvax.bitnet).

3.2.5. Information Concerning 16-bit Archive Organization

The digests are numbered sequentially as they come in. Sometimes the files arrive here out of order, or with missing ones, or with extra ones or with mail from BITNET users requesting information. Often the moderator has to logon to LISTSERV and re-name the files according to the "Subject:" line within it. Those "Subject:" lines are what end up in the indexes (in both "-A16" lists)

The program files are largely extracts from the digests (INFO-A16). As far as possible, they are numbered the same as the digests they came from. Other programs were inserted somewhere in the list. The numbers of these "inserted"

files were selected so that they would appear in the index at about the correct CHRONOLOGICAL sequence. If no programs were included in the digests, and no contributions were received, then those spaces in the index numbers were left blank.

3.2.6. Supplemental information for BITNET users

Bitnet sites normally cannot make a connection to an internet site (such as Score) and FTP files over, so you do not have direct access to the archives on radc-softvax.arpa from your BITNET site. However, BITNET has some sites with all the good stuff, so you can get files from there. The LISTSERV's at CANADA01 and FINHUTC have old digests, and the ATARINET server at Univ of Houston has most of the best programs. You can get to the LISTSERVs by saying

TELL LISTSERV AT FINHUTC GET ATARI FILELIST

or

TELL LISTSERV AT CANADA01 GET ATARI FILELIST

to get a list of files. To get a specific file if you know it's name, you can say

TELL LISTSERV AT <HOSTNAME> GET <FILENAME> <FILETYPE>

To get stuff from the Univ of Houston server, you can say

TELL UH-INFO AT UHUPVM1 ATARINET HELP

or

TELL UH-INFO AT UHUPVM1 ATARINET INDEX

for further instructions. After you know a file's name, you can get it by saying

TELL UH-INFO AT UHUPVM1 ATARINET SEND <FILENAME> <FILETYPE>

882. Re: A different view on multitasking.

Newsgroup: comp.sys.atari.st

Message-ID: <1987Dec25.141357.16689@gpu.utcs.toronto.edu>
Source record: 255432

When I started working as an advisor at UofT, TSO was the main system besides batch card jobs through JCL. Back then if you mentioned a Micro, you were laued at and told they could never do what a BIG machine could do. Too bad I have to use unix on a this SUN toy now instead of a 370 !!
Whats this have to do with multi-tasking? I'm not sure but the whole argument seems kinda stupid. Buy what you want. I have an atari for games and an IBM for programming and cad work. It would be really nice to have a multitasking Sun 3 but I can get by on less. If multitasking would force(?) programmers to produce better code then I'm all for it !

883. Re: Failing Disk Drive & Strange TPA pointer

>just a 1040 with a lesser drive and some RAM missing. Has anyone else put a
>different drive in their 1040 or repaired the original one?
>If so please advise me.
>(Note: Our machines will be down(ish) from 24th Dec to Jan 5th)

I have replaced the 1040 drives with the newer mech's that are
currently shipped as external drives. Have had no problem with doing this
at all.

If I were you, I would clean the head with Freon TF, and get all the
dust that usually seems to collect inside the drive. This is the main problem
that I have seen in the internal drives, other than the eairly drives having
the write protect to go out, in which case I replaced it with a small micro
toggle switch.

I have seen drives that were running slow, and still read the data
onthe disk fine, but didn't write for ^%$#*(. Also have seen some drives
that didn't write well either and the cause was due to a mechanical problem
with a lever mounted for upper head pressure. Problem was due to this lever
being a little loose and thus making alot of noise (like ball bearings inside)
and just getting this a little tighter lessened the vibrations allowing the
drive to again work well.

One other thing that I noticed was that some drives, lost the
ability to turn the disk at proper speed *if the drive was sitting in the
correct position. When I went and turned the drive over (upside down) to
further look at the problem, the problem was gone! Turn the drive back over
and the problem returned, turn it upside down, and the drive worked fine
again. Weird problem. Unfortunatly, the direct drive motor for turning the
media is not available from Atari, so a new drive was installed. One of the
newer external ones. Problem solved....

>If I were to buy such a board, I would probably *never* find the bugs.
>

I've been using that package for a year, and the only bug I've encountered was in the clock setting software, which would cause the clock to freak in February.. it was quite amusing actually, and it was fixed immediately (Chris would actually tell you the location to patch in the executable if you didnt want to wait for him to send you a new disk). No other bugs as far as I know,

886. big arrays in MW C

Newsgroup: comp.sys.atari.st
Date: 1987-12-26 04:24:08 UTC
From: trb@stag.UUCP
Message-ID: <291@stag.UUCP>
Source record: 255436

Hi,
Does anyone know if MWC will safely handle large arrays now? I know
that I had problems in the early versions with HDSCAN's arrays in that
I had to keep the total amount of data in a particular array less than
32K bytes. Now when I compile tests (i.e. a char[10000][12]), I get a
message like:
strict: size of array overflows size_t
which doesn't make sense, since size_t is a long if I remember correctly.
Somewhat confusing (and frustrating now that my manual is out of phase with
the newer version of the compiler that I got recently.)

What I really want to do is fold my Unix version of HDSCAN back into the
ST version, and preferably with MW C. If it looks like it will be too much
of a mess, I will probably wait for the new version of Megamax, since that
sounds somewhat promising as well. (Yes, the Unix version is done...I
am mailing the source code to comp.sources.misc next week. Supports both
BSD and SYSV flavors of Unix).

-Thanks,
Todd Burkey

887. How advertising helps already-owners

Newsgroup: comp.sys.atari.st
Date: 1987-12-26 14:13:13 UTC
From: denbeste@bbn.COM
Message-ID: <5600@cc5.bbn.COM>
Source record: 255437

Michael Vederman (uace0@uhnix2.UUCP) asks:

> Okay, how can you change Atari's image? Does it matter? Sure,
> more advertisements would be nice, but what benefit do we, the curreniet
> owners of STs derive from that?

The rationale goes as follows:

If the advertising is effective, more ST's will be sold, and the installed base will get bigger. This will attract more third party software vendors, who will write more software for the system, which means a better and wider availability of software for those who already owned the machine when the advertising began.

Clear?

I agree that Susan, John and the kids Averageuser family generally does not need to do multitasking at the user level very often. I've spent quite a few hours manning a user support center that helped people deal with stuff from TRS DOS (chuckle) all the way to big multiuser Unix environments. The Averageusers almost always approach the machine in a task-switched modality. For instance, they shrink down the editor window and go browse files for the desired inclde text. It is awful difficult to browse and type into an editor simultaneously unless your've got four hands.

BUT.... Writing in a task-switched environment is difficult. I've worked with writing for MS-DOS windows which is a lot like writing for the McIntosh and GEM/TOS environments. You've got to be awful careful about not stepping where you shouldn't be, behaving yourself and being a "good citizen". I find that dealing with the fluff of such an environment is not insurmountable but does detract from my productivity on addressing the desired programming end product.

I much prefer working in an environment where the O/S does the dog work of being a good citizen to the system resources. Dynamic control of task priority is also much easier with a real multitasking O/S. The enduser needn't really be aware that some priority control is going on. Such a benefit to the programmer is to be able to control how much time a print spooler gets. When the user is doing hunt-'n-peck, the print priority can be high, and then knocked down when a spelling check is begun.

The whole point is that while the enduser may not use the features of a multitasking O/S directly at a high level, it makes life easier for us to develop tools for the enduser. Even if the enduser tools themselves don't take advantage of multitasking, being able to develop under a multitasking envronment allows us to be more productive and shorten the lead time in delivering the product to the enduser. This means for sales (ching ching) for us; and that's what matters most, right?

OK, here's an example that really can't be done without a multitasking O/S: the Mimetics Pro Midi Studio. It is diffiult to explain exactly what Pro Midi Studio is like without actually seeing it run. It is true that PMS addresses a relatively small market segment, but applications for other users just haven't been thought up yet.

Happy holidays,
--Bill

In article <36598@sun.uucp> cmcmanis@sun.UUCP (Chuck McManis) writes a lot of good suggestions about buying a computer. I can't understand this though:

>* Don't buy a computer to learn programming. If you ever want to program
> a computer you own, learn programming *first*. Then you will know when
> the programming environment a computer offers is usable.

How is someone going to learn programming without a computer? Granted, Usenet people must have access to at least one. But the world at large does not. Don't tell me you are going to just sit there and read a book; very few have that much willpower. And even if someone did, would he/she learn anything about which computer to buy? Very little, probably.

|>anything about which computer to buy? Very little, probably.

I suggest that if you want to learn programming you take a class at a
community college or through some other program where they provide the
computer. The reason being that the things that make a computer easy
to program, and the programs that make a computer useful may be a
disjoint set. Have you ever programmed on a ZX81? Not much fun. Or
maybe you buy a commodore 64 to learn programming, and then find out
that you really want to program in C and no one makes a C compiler for
it. Maybe COBOL is your idea of fun, that wipes out the Atari and Amiga
right there. But the biggest danger is that you may discover you can't
program, or hate to program and now you have this essentially worthless
computer (remember the condition was that you bought it to learn programming).
I know a lot of people who have bought computers, the ones that took a
programming class were a lot happier. You learn a lot about computers
when you take a programming class. It gives you an edge, I heard about
a guy that bought a computer to program on that had only a line oriented
editor because the salesman had convinced him that editors that supported
editing on a "hard copy" terminal were more powerful than screen editors.

I still have not heard one counter argument against the value
that multi-tasking has as a tool for the programmer to use to
write better programs. Perhaps the user does not see this as
multi-tasking, but benfits from it none the less. After all,
this is a powerful tool and we programmers can use it to make
what would otherwise be a difficult task an easy one. This
this translates to less expensive or more feature full programs.

I have never said that multi-tasking was "essential". However,
it is a VERY powerfull and usefull tool for both the software
developer and the user alike. And you need not use it if it is
too much for you.

As far as this OS/9 buisness goes, if it were being distributed
free then it might mean something, but from what's been said it
will be held by only a small fraction of the ST users due to its
price. Thus programmers will not be able to consider the bulk of
the ST market when depending on OS/9, and will not be likely to
do so. So much easier when its included with the basic system!

Thanks, Happy New Year,

Wade.

> accessory" [IBM PCs have desk accessories too, folks]) you already have
> as much power as you're ever liable to need in most environments.

Let's face it, even a Timex Sinclair with 16K of RAM can do all of the above (just a bit slow and limited). A boat-anchor CP/M system can also do all of the above, and would be cheaper (nowadays) besides. But I sure the hell don't like to use one after I've used BSD4.2 & other OS's that take advantage of multitasking.

For example, take the term paper. I'm using an 8-bit single-tasking system right now. I set it to printing. Then I go away for 20 minutes while my NX-10 bangs away in near letter quality mode (more "near" than "letter", but that's the breaks!). That irritates me. Greatly. There's a couple of things I could do here: Use my RAM-disk and jam a software interrupt-driven spooler on my LST: device (multitasking!), go out and buy a 512K print spooler (multitasking again, although in this case with a dedicated processor), or any other number of things. All of which are multitasking. All of which are a kludge, and would be unnecessary if real multitasking was available.

I remember my first computer. 5K of RAM, 16K of ROM, I was in hawg heaven, a computer all my own, to hack in 6502 assembly language on. I lusted for 16K, because with 16K, you can do anything, right? 64K? forget it, 64K was for rich folks with $2,000 to buy the latest CP/M boat-anchor (so-called because of its size and weight, in this case :-). Disk drives? Why would anybody want disk drives? I can load and save just fine with my cassette recorder!

Then I moved up to a 64K machine with a disk drive. Wow. Big time now. I'll never take that 5K machine out of the closet again (even tho I expanded it to 16K). After all, it's just an obsolete toy now, right? and 64K... I can do

ANYTHING! Wow, what power. Why would I want one of them fancy dandy 68000 machines, 'specially when they all cost $5,000 for 256K of RAM, and I can do everything they can, on my li'l min-anchor? I mean, I can process words, I can write programs, I can play games... they do all that, right?

There's 2 points I wish to make:
1) Some features added to the computer make it more productive and easier to use (compare cassette deck to floppy drive to hard drive!).
2) Most of us are notoriously short on foresight, like I was when I thought that 64K and a floppy drive was the epitomy of computing (after all, I can do everything you can, right? I can process words, play games, etc.?).

While you may not see the use of multitasking, I bet you're as foresighted now as I was 10 years ago when I thought that 16K of RAM was big-time for a microcomputer.

So, let me see... If there is a disk in the drive at power-on, the Supra
boots *immediately*. If I have the three keys down (diskette in drive),
Supra still boots immedately. Seems like I have to: turn machine on. Wait
about one second. Push the three keys. (Maybe wait for ST to go after the
floppy drive again) Push diskette into drive while holding the keys down.
What a pain! I don't think it'll work, either.

I'm going to call Supra today and ask them if they have a boot program
that is a little less zealous ;-)

Thank you, Alan, for the informative answer, which raises another question...

In article <914@atari.UUCP> apratt@atari.UUCP (Allan Pratt) writes:
>
>The media-change sensing is done using the write-protect signal from the
>drive. ...
>
>When a disk is in the "maybe changed" state, the next access (through
>RWABS or maybe Floprd) will check the serial number of the disk in the
>drive. If it hasn't changed, then the disk hasn't changed, either.
>This is another assupmtion: you should not have two disks with the same
>serial number.
> ...

What is the "serial number" you mention?
I have seen no mention of it before.
I have noticed something called "disk label" that comes up
when I ask it to "SHOW INFO". Is *that* the "serial number"?

How can I be sure that no two disks have the same serial number?

OK, where did this come from, how can we get the reworked ADVSYS, and, most important -- are there docs on how to program it? The original ADVSYS is fascinating but ultimately frustrating because the docs don't give you enough information to actually program the durn thing!

904. Re: Multiuser BBS

Newsgroup: comp.sys.atari.st
Date: 1987-12-28 18:21:16 UTC
From: neil@atari.UUCP
Message-ID: <918@atari.UUCP>
Source record: 255304

In article <1479@saturn.ucsc.edu>, koreth@ssyx.ucsc.edu (Steven Grimm) writes:

> The ST's BIOS is re-entrant. GEMDOS is not. (I have a multiuser BBS
> system to prove it...)

OK, Steven, where's my copy of the multiuser version? And whatever hardware it takes to make it work. Atari Base is waiting...

Maybe I'd better backtrack a moment. Here in Atari, we run a free BBS for users. It's known as Atari Base, and can be reached at 408-745-5308.

Here's the rub -- we run 5 lines into 5 separate systems. The line you get through to is simply the first available line. But, if you leave a question on that line, you'd better make darn sure you get back to that line.

We're looking for a solution. We need a way for the lines to talk to each other. Solutions that have been discussed, in order of preference, are:

1. Multi-port RS232 box that lets several modems talk to one ST. The advantage is that we'd need one computer instead of 5. The disadvantage is that if the one system goes down, everything dies. We're willing to live with this, because system crashes have been extremely rare in the 2 years since Atari Base opened in its current configuration.

2. Network that lets each line share messages. At one time there was talk of trying a MIDI-based network, but work on this was shelved by QMI due to the inability to resolve conflicting RS232 and MIDI interrupts. Maybe "PromiseLAN" will solve this one.

3. Using a system like Fnet or Fidonet and having lines call each other to pass messages. Not too elegant in my book, and lines are only updated at intervals (probably daily), but we could do this today if we wanted to.

The other burning issue is, which software to use? We're currently using the Michtron BBS. Michtron has abandoned its plan to sell a hardware multiport gizmo because the engineers in the UK who were working on one couldn't get it to work.

FoReM 2.0 supports Fnet, so if we wanted to go to approach #3 we could do it. But with the number of novice callers we get, I'm a bit leery of using FoReM. Any comments to the contrary, netlanders?

NiteLite Systems now has a hardware device to let 4 or 8 modems share an ST. Their BBS program supports this. But... well, I used NiteLite on the 8-bit before we went to the ST on our board. I like NiteLite's message facility, but the program needs improving in the user log (not sorted at all) and the download area. Paul Swanson, NiteLite's author, is working at making improvements, and is very willing to take criticism and act upon it.

BB/ST is very powerful, and Steven Grimm is working on the multi-line facility. But we're still waiting on some hardware. QMI is a great little company, but I know they're (almost) as overworked as we are at Atari. So, timetables for this are in doubt. Also, BB/ST's tree-structured message base is not my cup of tea.

And then there's BBS Express ST. Keith Ledbetter is doing a nice job on this one. The message base and file areas work well. But there's been no hint from ICD about the prospects for a multi-line function. I'd like to hear of one, because I like the program, which has a nice extra for us -- the script language for it would make development of an online order entry system fairly simple. It would be a boon to users to allow them to order spare parts online.

One last thing -- we're committed to running the whole thing on Atari equipment. Partly because of budget (total cost for system hardware out-of-pocket to date has been $0), and mainly because it's a good excuse to push the envelope of what can be done on the system. The makers of BBS programs would love to see us use their program, because it's a great promotion for them. So, I tell them to give me what I need! Maybe some day it will work.

Just to not irritate anyone, I'm aware of the PD program STadel, but this one gave new users fits when I tried it at home. And there's CBBS from Oasis, which just came in and hasn't been tried yet. No word on multi-line functions here either.

Any helpful advice from netland?

You're correct, Farrell. The 40 folder limit still exists in the ROMs. We
still recomment FOLDRXXX.PRG as the fix for the problem.

Which ST periodical was this? I thought we had most of them trained to call
and verify information before printing things like that.

*** FLAME ON ***

What good does it do to start rumors like this?

Do us all a favor, if you need something to talk about, discuss the weather.

I'm not saying that it wouldn't be nice to add features to the machine.
But, we're not adding this one at the moment. And there are so many rumors
getting people jazzed up for nothing...

The rumor mill in our community has gone a bit haywire lately. There's
enough going on without people making things up.

Most ridiculous rumors of 1987 awards:

1. The blitters didn't work, so we're using kludged-up Amiga blitters.

2. The blitters partially work, so we removed 4 of 8 functions from them.

Please, folks, give us a break. We're easy enough to talk to if you want to
ASK a question. Sometimes it seems that rumors are so much fun that their
veracity has no bearing on how they spread. Sometimes they spread AFTER the
facts are clarified -- fiction being more fun, I presume.

*** FLAME OFF ***

Sorry folks, but it's been a rough year.

Best to all for 1988! Hope you're having a good holiday season.

I just got off the phone with a tech-support guy at Supra. He tells me that
the scenario described above is exactly what I have to do; they cannot
program around it.

They say that the problem is in the "blitter" ROMs. The keycode that is
made by ctrl-shift-alt isn't available to the Supra boot program as soon as
that program would really like it to be. The boot program cannot detect
the key combo until much later in the boot, at which time the program is
just about to boot from the fixed disk anyway.

>to ICD, Inc.

I, too, am a VERY SATISFIED customer of BMS. My opinions of the ICD offering
differ somewhat from yours, however.

I saw ICD's product at the Worcester AtariFest, and while I think they have
an acceptable product, I believe that their methods are less than acceptable.
My local Atari dealer (exclusively Atari for the last 4+ years) tells me that
ICD has been present in the 8-bit marketplace for a considerable time.

My contact at BMS, however, told me that ICD initially contacted BMS with a
great deal of interest in the BMS board, and assured BMS that ICD was not
going to get into that business. A short while later, ICD released a board
which has a strong resemblance to the BMS board with a few modifications.

Note that I am NOT advocating sole-sourcing of add-ons for the ST line -- I just
do NOT like the idea of an "established" company staying out of the ST marketplace
until (or unless) they can piggyback off of the efforts of a fledgling operation by
misrepresenting their intentions.

As to your first reservation (above), BMS follows the Atari standard of only allowing
4 partitions per drive, while Supra established an "extended format" which permits
8 partitions per drive, but is NOT compatible with Atari's AHDI. ICD follows the
Supra extended format. I think if you go back to Tom Love's excellent article in
a back issue of Current Notes you will find that BMS did not have a disk driver of
their own, and that users would just use Atari's formatter (format.prg?) and
driver (ahdi.prg).

ST World is apparently going fine; in fact they've now split into
two separate newsletters:
ST World mainly reviews and show reports
ST Informer more general articles, rumors, etc.

They're carried by stores in the Oregon area (B. Dalton's Software Etc.
even carries ST World).

However note that they are not published on a regular schedule; as far
as I can tell they wait until they have enough ads and articles to fill
an issue and then go to the printers/distributors.

>message like:
> strict: size of array overflows size_t
>
This message is just a warning -- it is because size_t is in fact an
unsigned int in MWC 2.1.7. size_t is the default type of the result
of the sizeof operator. MWC does support objects larger than 64K now,
and this warning is harmless unless you are passing sizeof(foo) to a
function that is expecting an int. Sizeof is promoted to a long when
it overflows the unsigned int. When MWC releases an ANSI conforming
(rather than K&R, which is what it conforms to now with some ANSI
extensions), size_t will become a long instead of an int, and then
this kind of warning will go away.

Even in version 2.0, external objects of > 32K were supported, they
just could not be declared. They could be allocated with lmalloc()
and then accessed as arrays using the pointer/array equivilance.

I hope all of this helps.

Speaking of being short on foresight, it was only today that I was modifying
my handy dandy disk re-organizer program (Devices are a pain!) and guess what?
I was trying to ^XF (save and finish up) out of Emacs and was out of disk space.
How many of you have ever told an editor you were finished, fallen short of disk
space, and lost everything because the editor was not taught social graces? I'm
sure I'm not the only one.
Solution? Use my MULTITASKING Amiga to clean out some disk space before I
clicked on the retry block of the requestor.
Result? I didn't kill my entire family due to the frustration of losing my
program.
Moral? Even though nearly anything can be simulated with proper programming on
a non M-T system, it rarely is. Many programmers take short cuts which
do not allow for mistakes. M-T'ing systems are like insurance in case
your favorite program has problems.

Don't apologize for me you nimrod. I have nothing against ST's or their
owners. But Atari people who blather in comp.sys.amiga about how
the amiga's features are "not needed" are fair game.

If you want to flame amiga's, fine. Do it in comp.sys.not.amiga. Do it
in alt.flame. But do it in this group, and you just may get a rebuttel.
Do it four times and people may get testy.

Tony:

I tried several times to reach you via e-mail, but was unsuccessful (not surprising since the path was 17 machines long). There is a prograam called STSPEECH that will speak a line typed in on the keyboard or speak an already-created text file. Needless to say, it has a very strong "synthesized speech" accent but it really quite understandable. It is a public domain program. Send me e-mail if you want the details.

re: bugs in bms package -

i've been running a bms-based hard disk system since last january.
the only bugs i have ever encountered were software bugs. recall that
the bms adapter board has a battery-backed clock. it seems that chris
rhodin, the guy who runs bms and does the development, made a very small
but important error in the clock-setting program (settime.prg, i think -
the one that goes in your auto folder) which screwed up on february.
actually it was kind of humorous. never affected hard disk use at all.
he found the problem feb. 1 1987, and had updated software out in the mail
to everyone shortly thereafter.

i'm mainly posting this to stop what could be a harmful rumor. i am a
very satisfied customer of berkeley microsystems. their product is
reasonably priced, in my opinion, and their telephone support is superb
(of course, before they had any documentation, it had to be! :-)

the bms-100 adapter has evolved somewhat; it is supposedly laid out more
attractively on the board, it is pretty well documented, the software has
all been rewritten. it's a pretty mature product now.

if there were hardware bugs, i would be interested in hearing about them.
if not, please don't do bms any disservice by spreading such rumors.

one more note: i wrote an article for ST Applications magazine last spring
detailing the construction of a bms-based hard disk system for the ST.
it covers all the details of a single-HD system, and vaguely addresses
the double-HD system too (at that time i only had one HD). it appeared
in march 87, i think. at that time i offered to mail out copies, in
either electronic or paper form, to anyone who requested one. that
offer still stands. note that the electronic form omits the graphics
(done on my cad system at work, not on the st), so if you want the whole
thing you should buy the magazine or request the paper copy from me.
if you want electronic, mail me at the address below; if you want paper,
send me a self-addressed stamped envelope to the postal address below.

This reminds me of a joke. . .

A guy goes to a doctor and says "Doc, it hurts when I do this" (he lifts
an arm up, or something)

So the doctor says, "well then, don't do that".

If running marble-madness slows up a compile too much, don't run
marble-madness.

The moral of the story is, don't ask us do be limited by others "limitations".
As opposed to IBM, and now even (Cr)Apple, who are now bending down to the
lowest common denominator, who don't want to burden the average user with
unnecessary complexity (the original closed-Mac architecture was a
manifestation of this philosophy).

> it means I don't have to "share" any of my source with someone whom
> I may want to collaborate with.

I think Wade is right on target here. Multi-tasking does not have to be seen by the user to be important. On the Amiga, you can't HELP but use multi-tasking, because the operating system is using it all the time. Each disk drive has a separate "Filing System" process running (use MonProc, you'll see them), there is a separate input task running (I believe that Intuition really is an input handler, so technically, it runs as part of the input device task), each CLI window has a console task associated with it, the serial port has a separate task controlling it.

Why is this important? Because it makes it so much easier to do things. For example, early on in the Amiga's life, Matt Dillon (I think) distributed a set of asynchronous file routines. These are very useful, and almost trivial to implement under a multi-tasking OS (not to belittle Matt's work - it's quite good).

Or how about the Workbench? Contrary to many people's belief, the WB is NOT the operating system. It's just a program. A plain, old, ordinary program, with no special tricks or hooks. An ordinary mortal could write a program that does similar actions. Witness HackBench. I've often thought about writing a WB replacement myself.

If you want to talk about disk swapping, try switching between applications on a Macintosh. It has to load the Finder every time. Why do you think theres a "mini-finder" menu option? I keep trying to pull down the "screen" and use the finder which I expect to still be running back there.

I've written programs that monitor other programs (MonProc and MonIDCMP), and that run as input handlers (ClickUpFront, HeliosMouse, wKeys), and some stuff that I haven't released. These would be much more difficult without multi-tasking.

Code can be made much more modular with multi-tasking, and smaller, too. Unix people should love this, because you can make programs much more like filters, except you have both ends of the pipe running at the same time, passing data via a message port, or even a PIPE: device. Functions don't have to be duplicated from program to program. For instance, if I write a program that

graphs a function, I will not have to add a save-to-IFF-file option, because I already have a program that lets me select a portion of a window or screen and save it as an IFF file. That's a normal program - no special desk-accessory hooks, no special requirements about what programs I can use it with, or what ones I HAVE to have running when I use it.

Don't get me wrong, desk-accessories are great (I'd never be able to use a Mac without them), but they are an attempt to achieve multi-taksing where it's not built into the system to start with. Admirable! Great stuff! Keep up the good work! But don't complain when someone offers you what you've been trying to achieve all along.

> THE POINT IS THIS: As a programmer I find the idea of writing
> such a program as being much simpler with multi-tasking facilities
> than without them.

Exactly! Right on!

> My question for you is, what do you have against multi-tasking?

I also wonder the same thing. Where's the beef?

> Take OUR (all of us who have given testomonials) word for it that
> the disk swapping "nightmare" is indeed just a bad dream.

As I mentioned before, I'd hate to have to load the Workbench in from disk every time I quit using a program! I'm much happier letting it run in the background until I need it again.

One last comment: (finally :-) the times I find multi-tasking the most helpful is when I WASN'T expecting to have to use it. If I'm using a word processor writing a paper, and need to check some results, I can just start up my statistical analysis program to get my answers (and I can keep on writing while it loads in of the floppy). I don't want to have to know ahead of time that I need to start up whatever carousel or special multi-tasking editor I need in order to do this. If I knew ahead of time, I'd have done the statistics before I started the word-processor!

Well, I've gone on far too long as it is. Thanks for listening.

920. Hard drives for the ST

Newsgroup: comp.sys.atari.st
Date: 1987-12-29 21:16:31 UTC
From: chris@gen1.UUCP
Message-ID: <321@gen1.UUCP>
Source record: 255320

I have noticed a few requests on the net for information regarding
hard drives, hard drive kits, and the like for the ST. I have just
purchased a "TAMI-HD40" hard drive system from FutureDOS, and am *very*
happy with it so far.

I own an Atari Mega-2 ST and required a larger disk capacity in order
to run GEM, Magic Sac, and OS-9/68000 efficiently. The single drive system I
received from FutureDOS is in a long enclosure that is designed to accommodate
a second half height drive.
Since the system is custom made, I ordered the 44 Mb (formatted) hard
disk configuration, for which I paid $1400 Cdn.. Other capacities are
available upon request. Also, all of the hard drive systems are fully
assembled and tested, so reliability is assured.

If you are looking for a high quality/high capacity hard drive system
at a reasonable price, then this may be the thing for you. You can
reach the folks at FutureDOS by writing them at

FutureDOS,
1207-120 Torresdale Ave.,
North York, Ontario,
CANADA, M2R 3N7.
Tel. (416) 736-0321

Christopher Parkinson
yunexus!gen1!yuplanet!chris

BTW-Standard disclaimer...I am in no way affiliated with FutureDOS, I am
just another happy customer!!!

929. INTERRUPT PROCESSING

Newsgroup: comp.sys.atari.st
Date: 1987-12-30 20:19:09 UTC
From: jdn@homxc.UUCP
Message-ID: <2661@homxc.UUCP>
Source record: 255328

How do you disable and enable interrupts from
1. The keyboard?
2. The SIO port?

In the documentation at my disposal (Mark Williams C and Abacus)
I can find the following table under Jdisint:

Interrupt # event
0 I/O port bit 0
1 I/O prot bit 1
2 I/O port bit 2
3 I/O port bit 3
4 Timer D
5 Timer C
6 I/O port bit 4
7 I/O port bit 5
8 Timer B
9 sender error
10 sender buffer empty
11 receive error
12 receive buffer full
13 Timer A
14 I/O port bit 6
15 I/O port bit 7

Half of these are self explanatory, but the other half requires
a mapping to atari st hardware events. Would someone be kind
enough to inform me what events are represented by I/O port bits 0-7 in
the atari 1040 ST? I presume that one of these represents a
keyboard interrupt and another an SIO interrupt; otherwise
I really need help!

Thanks,

Jonathan Nagy

930. Multitasking - A nightmare

Newsgroup: comp.sys.atari.st
Date: 1987-12-30 21:21:51 UTC
From: larryw@dasys1.UUCP
Message-ID: <2406@dasys1.UUCP>
Source record: 255329

I think that this discussion is a little off-base in many ways. Would this be going on if we were debating the benefits of disk versus cassette storage?
You will be hard pressed to find ANY microcomputer of recent vintage that does NOT multitask to some extent. The Atari 8bits use multitasking. The ANTIC CPU interrupts the 6502 chip to generate the video. Smart programs turn OFF the multitasking during cpu intensive stuff (compiles for example) to speed things up, or write special multitasking programs (graphic displays). The POKEY sound chip works in a similar manner for the sound output. Disk controllers use dedicated chips (and DMA) to do their thing while the CPU does its thing. ON PCs, IRMA boards handle screen i/o and updates IN THE BACKGROUND, regardless of what you are doing in DOS. While you might split hairs as to whether this is multitasking,
parallel processing, or networking. Its a moot point. Multitasking is real,
is here, and has been a feature on most micros for the last six or seven years.
As fo Joe user - Mr Average - They may not buy computer systems as we use them, but have you looked into their cars nowadays? Computer controlled emission systems, fuel control and ignition, mileage calculators etc? All of these systems arehappily multitasking away in real time too (they better be). PS before I get flames that these automobile systems are not programmable, some of the hottest underground programming jobs right now is REPROGRAMMING these things to beef up the
cars performance (usually at the expense of emission standards) and the feds areseriously thinking about outlawing the chips and making their reprogramming illegal.

931. EasyDraw XX.XX

Newsgroup: comp.sys.atari.st
Date: 1987-12-30 23:43:37 UTC
From: parora@gpu.utcs.toronto.edu
Message-ID: <1987Dec30.184337.15985@gpu.utcs.toronto.edu>
Source record: 255330

I saw a demonstration of EasyDraw recently, the version # of which
I don't know. I have a few peeves about the package which prevent me
from purchasing it. Since I do need an object oriented drawing package
I wanted to confirm that my objections are legitimate. If they are, and
if EasyDraw is listening then please take them as suggestions.

1. Text cannot be rotated. (FATAL if you want to draw rough
graphs). The closest you can get is something like:

R
o
t
a
t
e.

Not too useful if you are considering drawing architectural
plans which require sideways printing for a better fit.

2. Exiting will always request if you want to save your file even
if you have made no changes since the last save.

3. You have to explicitly select an object and then click again
to move it. A single click should suffice the way it does with
copying files etc.

4. The default for text should be justify off. I usually use
text as labels and can't see why justify should be on. I also
forgot most of the time to change justification when entering
text so that I had to go and change text attributes - a real
nuisance.

Some of the features I wish had been adopted from MacDraw:

5. A cubic spline fit (called SMOOTH and UNSMOOTH in MacDraw).
A really useful feature when one wants to draw gaussians and
sine waves etc. the way I needed to for my thesis.

6. The ability of picking a larger than one page size for the
drawing and then having EasyDraw print it out serially page
wise. This allows more complex drawings to be mosaiced easily.

Has anyone had similar experiences?

932. WordPerfect Update

Newsgroup: comp.sys.atari.st
Date: 1987-12-31 00:26:39 UTC
From: parora@gpu.utcs.toronto.edu
Message-ID: <1987Dec30.192639.16337@gpu.utcs.toronto.edu>
Source record: 255331

Just a note for WP users. The new update is supposed to be
out in early January. Since I didn't get any response to my
previous posting about the numerous bugs in WP I am not really sure
if any WP users actually exist. 8-{)

In response to Neil Harris' comment that the support is excellent, I have
a few comments of my own:

1. No company, software or otherwise, should be able to release
a product that doesn't even come close to working.
Bugs are one thing - fatal bugs another. I use the following
analogy - If I approached WP and asked them to give me
a copy of the software, and then told them that I would pay
them in a few months i.e. whenever I could afford it, I would
not expect them to hand over the package. And yet, WP has
taken money from users and then handed over a useless package
without ever notifying any of its users that there are problems.
And when a user tracks down the bugs and calls WP, they say
they are aware of it and a working version should be out soon.
Soon in my case has meant 3 months now, and I still don't have
a working version.

2. A company that only includes its UTAH address for technical
support, even in packages sold in Canada can hardly be seen
as being concerned for all of its users. By the way the (800) number
doesn't work from Canada so that you have to call WP on your
own expense during the day at full rate. Technical support
does exist in Canada from J.B. Marketing in Cornwall. Their
phone number is : 1-(800)-267-1731.

3. Part of servicing a product means keeping in touch with the
buyers and users and being above board about things(i.e.
through bulletins). I have not seen
any indication that WP considers this a priority. This is
critical in the present case where there must be bewildered
users trying to figure out why a $595 software package doesn't
work.

I think the larger issue here is the ethics with which high tech companies
operate. Personally, I don't feel that WP has thus far exhibited anything that
qualifies it for the praise that Neil Harris had to offer. My experience
has been in dealing with WP both in Canada and the US for the past three
months now.

933. PrintMaster Icons

Newsgroup: comp.sys.atari.st
Date: 1987-12-31 00:49:23 UTC
From: silvert@dalcs.UUCP
Message-ID: <2752@dalcs.UUCP>
Source record: 255332

It is a long time since a nice set of PrintMaster icons was posted to this group. They are handy not only for PM use, but with a program by Sol Guber (shareware) you can convert them to Degas format for use with Publishing Partner, etc.

I am looking for a tool to manage PM libraries. I would like to be able to read through a library and copy selected icons to a custom library. You can do this with PM itself, but the process is cumbersome. Does anyone have such a beast, or some related code that will help? What is the format of the library entries anyway?

Are there any more PD libraries lurking out there? A large set was recently posted to a BBS that I run (almost 300 K!), but I spotted a couple of proprietary libraries in it and had to pull it off. It is a real pain trying to figure out what is and isn't PD!

If there is interest, and if I can figure out what is PD in the arc file, I will post some of the libraries. Any information or any files and PM utilities that anyone can post or send would be welcome.

By the way, the file includes a program that is supposed to dump an icon library to the printer. It doesn't seem to work well, but the output on my SMM804 makes me think it may work on a true Epson. If you want to try it, send mail to ...!dalcs!biomel (if you send it to this address I won't send it -- You have to use the correct address!).

Message-ID: <483@uhnix2.UUCP>
Source record: 255333

Rick Flashman asks: Are the authors of DC Format n the Net. There is a bug.

We are on the net.
We had this reported o us by Simon Poole a while back. This was fixed, but
what version are you running? One of the Oold versions didn't work right.
The latest posted version is either 2.32 or 2.31 I belive.
Check the version and let us know.

BTW - Look for a desk acces@sory version very soon, which has background
formatting. And with our product to download in the background, to
be sold by Antic (:-) a little plug), I can now download, word
process, and format at the same time. I believe this isn't bad for
a non-multqitasking environment. Was't that the ultimate test?

- Mike

| timetables for this are in doubt. Also, BB/ST's tree-structured message
| base is not my cup of tea.
|
+----------

And you're considering using BB/ST? Okay, it isn't as downright abrasive
as FoReM ST, but I have never found it particularly intuitive, easy to use,
or really fun. True, the sysop functions are neat (from what I hear...),
and I suppose it's pretty powerful, but it's still got that true tree-structure
message thingie, and it's just not _keen_. <<= opinions, guys...

Of course, if you loan one of these developers an Abaq for a while, they might
be more than happy to write up a multi-user message base that reads messages
off a LAN... I know Steve would... :')

I recently built a battery-backed real-time clock and a four
channel A/D converter to plug into my cartridge port. I bought
the board from,

Douglas Electronics
718 Marina Blvd.
San Leadro, CA 94577
(415) 483-8770

The board fits perfectly into the cartridge slot. It has holes
spaced at 0.10 inches, 20 rows by 30 columns, with 8 rows dedi-
cated for power and ground buses. The part number is 33-DE-40,
costs $10.00, they'll ship it however you want, and they accept
MC and VISA. I have nothing to do with this outfit other than
being a satisfied customer.

AGREED! I have been reading this board on and off for some time now. This due to many users on my system whom use st's. Multi-tasking requires very little "cleverness" and the OS often does the work for you. It doesn't take long to see the advantages and use them. For me, if I had to return to a single tasking enviorment it would be like some of you having to return to a 40 column screen (bleech). Your 68000 is mot likely barely used. Why not give it abit extra in the way of jobs? Multi-tasking makes you far more productive. Useless award - this is right. I would guess that the most likely feature to be seen on all future machines will be OS's that multitask. Why the heck should you have to stop working just because your OS can't "talk and chew gum" at the same time?

Subject: Developers Kit

Originally, the Developer's Kit was a $300 package that contained five diskettes and a small mountain of generally useful but sometimes spotty documentation.

The disks contained the Alcyon/DRI C compiler for the 68K, originally written for CP/M, and sorta ported to the TOS environment. It also has additional libraries that hook into GEM and all that. You also get the MicroEmacs editor, a resource editor, and a bunch of odd tools to support the compiler.

The docs were for: GEM, VDI, The C compiler, the "line-A" functions, hardware (including poop sheets for most of the big common chips), old 520 ST schematics, etc. A good, solid three binders worth.

You also got a "non-disclosure" agreement to sign and return to Atari. You must sign and return the agreement, along with a recipt for the kit, to Cindy Claveran at Atari to become a "registered developer".

From what I have heard on the net, Atari has un-bundled the kit. You can now purchase the "support" part of the kit for about $100. This part is what would entitle you to access the Developers sig on Compu$erve, buy the "blitter ROMs" from Atari, etc.

>one gave new users fits when I tried it at home.
>
>Any helpful advice from netland?

Several thoughts. First, STadel seems to be a bit more user-friendly now than it did 6 months ago. You might want to log into the STadel development system sometime and check it out again (612-377-9239). It would be nice to have at Atari, since STadel has a UUCP option now (several systems are linked directly into my Unix box at this time.) In fact, if anyone is interested, they can mail to the author of STadel at orc@pell.UUCP or ...ihnp4!meccts!stag!pell!orc. There is even the possibility of having comp.sys.atari.st redirected into message rooms (not sure if that feature is released yet). And, since STadel has room sharing between systems, that would solve your other problem with technical questions getting lost.

One other thought. Stadel is best used as a message base system. You can log on with minimal fuss, quickly find the section you are interested in, read what is appropriate, leave a message, and log off a lot faster than any other BBS that I have ever used. That is important for those of us who worry about our phone bills when calling the Atari BBS (and also keeps the lines available). If you could reserve say three of your systems for downloading using whatever your favorite download type BBS is (how about running Collie under PC-Ditto :-) ...that is my favorite for downloading and maintaining as a Sysop) and two systems for questions and answers using STadel, you would probably improve the usefulness of the Atari BBS considerably.

-Todd Burkey
trb@stag.UUCP

P.S. When I first saw STadel, I too went "Yech...what the ?@#? is this?"

942. 40 folder limit

There is a single format developed by CompuServe called GIF. The complete
docs are available there in the Graphics SIG.

For the ST, there's a shareware program called PICSWITCH that converts all
ST formats and resolutions, and is also compatible with Amiga and Mac
formats. (Is there a PC format?) PICSWITCH is up to version 7. It should
be on the Atari BBS (I know version 6 was there last time I looked).
Version 7 is on GEnie for sure, because that's where I got my copy.

Message-ID: <8712312200.AA15560@cory.Berkeley.EDU>
Source record: 255344

: I think that this discussion is a little off-base in many ways. Would
:this be going on if we were debating the benefits of disk versus cassette
:storage?
: You will be hard pressed to find ANY microcomputer of recent vintage
:that does NOT multitask to some extent. The Atari 8bits use multitasking.
:The ANTIC CPU interrupts the 6502 chip to generate the video. Smart programs
:turn OFF the multitasking during cpu intensive stuff (compiles for example)
:to speed things up, or write special multitasking programs (graphic
:displays). The POKEY sound chip works in a similar manner for the sound
:output. Disk controllers use dedicated chips (and DMA) to do their

Ever heard of newlines? You paragraphs were all one single line!
I think *you* are slightly off base a little here. Every microcomputer down h
to the old Apple II's (and older) has interrupts. Interrupts and DMA does not
a multitasking computer make. I think the definition everybody has had in mind
throughout this affair has been:

-preemptive scheduling
-each 'task' is an independant entity with no restrictions relative to
other tasks (Read: Not an interrupt, Not DMA)
-The OS supports the fact with signaling, control, and communications
calls, is reentrant, etc...

The overall idea being that you can then run completely independant
applications simultaniously. After all, any semi intelligent hacker can write
a simple context switcher for his or her particular program.

Now this business of running more than one application at a time
has been argued to be not all that big a deal. Even discarding the rather
silly arguments over exactly what one would want to run simultaniously,
multitasking has distinct advantages in other areas. Take a look at the
number of problems multitasking simplifies (things you CAN DO NOW with hacks or
complex programming):

-DA's (graphical clocks, calculators, etc...)
-Printer spoolers
-Networking
-Asynchronous IO
-Multi-line BBS's **without** delays
-program debugging
-OS hacks (hot keys and other items)

Looking at the amount of money and time Apple has invested
attempting to match the Amiga's multitasking. Even if you don't give a
bull's toe for the Amiga it should be obvious that the future of
microcomputers is turning towards multitasking. Look at (Bletch) OS II for

the IBM! If anybody has ever had a rock solid will-never-change attitude it has been IBM.

As I said, the above can be done NOW on the Atari, but it takes a lot of work, and many incompatibilities crop due to the lack of a standard way of doing some of the above. I think that simply adding a couple OS calls to support a rudimentry multitasking (to go beyond Apple's task switching) would be a big boon! The first step is to share the CPU.

-Matt

948. Zoomracks (i.e. Hypercard's predecessor?)

Newsgroup: comp.sys.atari.st
Date: 1988-01-01 01:31:53 UTC
From: parora@gpu.utcs.toronto.edu
Message-ID: <1987Dec31.203153.28991@gpu.utcs.toronto.edu>
Source record: 255348

I was just reading this quarter's STart magazine (Wint87), and came across an article on Zoomracks - an ST product which sounds a lot like Hypercard for the Mac. One major difference being that Zoomracks has been around for 3 years.

The article is interesting. If anyone has used the product, perhaps they can post their views.

Why hasn't this product come to light earlier? One thing I did notice was that the screens used in this article gave a definite edge to Hypercard since there were beautiful graphics mixed with text. Is this a shortcoming of Zoomracks?

By the way the author of Zoomracks is Paul Heckel - the same person who developed the Craig Language Translator and wrote "The Elements of Friendly Software Design" (This is from the article).

Most of the machines have programs that will convert a number of foreign
format to "native". This does not help much in swapping them back, however.

Computer Shopper ran a recent feature on this exact topic. (December 87
or some issue close to that).

As far as personal experience, the only single, general** picture format I
have seen supported on all the machines above is IFF picture files (ILBM).
This format was born with the Amiga computer, and is good enough to have
traveled to other machines.

** By general I mean several things:
1> Must handle color (of *at least* 8 bits per pixel, if the source image is
that deep).
2> Must handle arbitrary sized bitmaps.

Several of the other graphic interchange formats fail to pass those two
simple tests.

> (Just the facts, ma'am)
> Ron

OK. We (Athabasca University Computing Services) got our kit sometime in September or October of 1986. I cannot speak for later Developer's Kits than that. Honestly, I can only say that it was better than the doc's I got from DRI when I first got CP/M - you old CP/M hackers out there can go from there ;-) For the rest of you, I can only say that reading and using the docs supplied was a little like playing Adventure - except that it's a lot slower and more frustrating. If some kind soul hadn't posted the "Proffesional GEM" (by Tim Oren) stuff to the net, and if I hadn't gone out and bought the MWC package, I don't think we would have ever done anything interesting with our 1040's. Sigh.

To start, there is a very large stack of paper, perhaps 5 or so inches thick (8.5" x 11" paper, double sided xerographic copies). I have it in three two-inch ring binders, and they are _full_. The quality of the reproduction is a little disappointing, but readable; the only frustration is that occasionally the copies are skewed so that some text falls off the edge of the page. This is not too much of a problem.

Volume 1: (about 580 pages)

a nondisclosure agreement

some waffle about 'please write portable code in case we decide to fool around with the hardware specs'.

some blank SPR (bugreport) forms. If I had used these things, I would have needed 20 times as many as are supplied.

keycode table errata list

writeup on the ACSI buss (interface & protocol) [hard disk port]
+ listing of (23Jul85) hard disk driver as example of ACSI stuff.

Introduction to Gem Programming (DRI): this is the IBM version, it does not exactly conform to the supplied software.
Pretty obscure in places, but valuable to the initiated.

GEM Programmer's Guide - Vol 1, VDI (DRI): a description of the
low-level graphics primitives in _excruciating_ detail,
plus a little bit about the non-existant GDOS, and some
very useful info on font files. This is a reference
work, very few examples of actual use. It is pretty
complete, but again more useful to the initiated than
the novice.

GEM Programmer's Guide - Vol 2, AES (DRI): a description of the
higher level stuff in GEM, such as the window and event
libraries, menus, manipulation of icons, et c., et c.
Again, a reference document. Lots of info if you know
what you're looking for, but not a tutorial at all.

Volume 2: (about 400 pages)

GEM DOS 1.0 specs (DRI): calling conventions & stuff.
Readable, useful. Includes C bindings.

Hitchhiker's Guide to the BIOS: for a change, a really pleasant
piece of doc on the BIOS - has a few errors, and can get
a little self-indulgent (and obscure), but still a solid
source of info on the low-level stuff. Lots of neat
stuff on how booting is performed, & c.

Line-A Technical Reference Manual: detailed discussion of the
bit blt code, parameters, & how to call it. rather
confusing organization, and again the attempts at humour
can be irritating on the 500th reading. Not for the
faint of heart.

Intelligent Keyboard (IKBD) Protocol: really good writeup of
how the mouse, joystick, and keyboard work. I wish _all_
the docs were this good.

BIOS listing: a listing of the ST's BIOS. I sure wish this
had been the listing output by the assembler, as it is
there is no symbol table or hex listing, so it's a pain
to follow the code around. But handy when you have to
know _exactly_ how something works.

Volume 3: (about 600 pages)

DRI 'C' Language Programming Guide for CP/M 68K: this is the doc
for the (in)famous Alcyon C. Ugh, blech, ack phfft! I
cannot say anything good about the thing.

DRI CP/M 68K Operating System Programmer's Guide: this is the most
useless thing you could imagine. It has nothing to do with
TOS at all. The only good thing is that it explains a few
things about SID, the linker, and the assembler. Otherwise
it only confuses anyone who doesn't realize it has nothing
to do with using the ST.

Kermit User's Guide, Fourth Edition: I never used this & have
no intention of ever using it. We have ZMODEM :-). But
it looks well enough written.

Engineering Hardware Specification of the Atari ST Computer System:
A good quick overview of the ST. Terse and pithy.

Western Digital WD1770/1772 5-1/4" Floppy Disk Controller/Formatter:
This is a typical engineering component data-book sort
of description; very, very complete and includes
examples of anything you would need to know, and a lot
of stuff you don't need to know (like pinouts). Aimed
at engineers.

MIDI Specification 1.0: Now this is a real prize. It's
exactly one page long, and says 'for more information,
please contact...' and gives the address of the IMA.
Really! Somebody was working overtime on this, I'm sure.

(Untitled): long, unreadable & boring description of the STC504
and SMM804 printers. Typical Japanese-style (no racial
slurs intended) printer manual organization of jillions
of tables, everything cross referenced to something on
another page. NO examples.

(Untitled): etch masks and schematics for building ROM
cartridges, plus mechanical drawing of connectors. OK,
I guess; my ex-wife, who does this sort of thing for a
living, wasn't very impressed. Me, I do software :-)

United Technologies/Mostek MK68901 Multi-function Peripheral:
Just like the WD1772 writeup. More stuff than you ever
wanted to know, or thought possible.

Schematic Diagram: a schematic for a 520ST. two 14" x 11"
sheets, hard to read, and not the best organization.
Still, it's enough to figure out things like 'which bit
in the 68901 do I fiddle to assert DTR on the serial
port' and that sort of thing.

--

And that brings us to the end of the stack of paper. In summary,
there's a whole lot of information here, but d*mned little guidance.
It really needs something like the "Proffesional GEM" series to get
the newcomer started - as it is you're so busy reading about every leaf
on every tree you have no idea at all what the forest looks like ;-) !

Also, there's no master index. Some of the separate documents are
indexed, but you have to know which one to look in first, which means
plowing through all 1600 pages at least once. You can bet that takes
some time...

"And now, Ladees and Gennelmun, in the center ring! It boots, and who
knows, maybe you can even do developement with it! (I sure had a h*ll

of a time, though.) The amaaazing Atari Developer's Software Toolkit!"
This sorry collection comes on 5 single-sided flops. I hereby list
them:

Flop 1 - C Compiler, Assembler, and .H files

The dreaded Alcyon C compiler. At the risk of redundancy, let
me restate my earlier comments: Ack phfft!! The poorest commercial C
compiler you ever met. Generates assembly output, useful for deciding
what kind of bugs it has introduced into your code this time around...
Slow, buggy, and not even full K&R much less ANSI. Daryl (the other
hacker in this shop) struggled with it for about 3 months and even got
some stuff to work :-) but I wouldn't touch it with a barge pole.

Flop 2 - Linker, Libraries, Thing to make Linker output executable

An amazingly slow linker. Libraries with some *nasty* bugs in
them. And a hack to get CP/M 68K executables to run under TOS. Gag me
with a spoon...

Flop 3 - Utilities: Debugger, Kermit, and some C runtime environment asm code

I sort of like SID, probably because I used it under CP/M so
much. We never did use the supplied KERMIT. The other stuff was ok,
but pretty ho-hum; no RAMdisk or anything remotely useful like that.
The APSKEL.C (application skeleton - sort of a 'hello world' for GEM)
was a good thing, although I think that programmer should be shot; his
style makes my teeth ache.

Flop 4 - Icon Editors and Resource Construction Set, plus Doodle C source

Again, having source code as an example is a really fine thing.
The only problem is that since it's designed to compile under Alcyon,
you spend most of your time wondering "now why is he doing that?"
instead of seeing "oh, so that's how you do <arbitrary GEMish thing>".
The RCS is useful and pretty completely undocumented (there are a few
hints in 'Introduction to GEM Programming' (Vol 1), but nothing like a
real write up anywhere). To an experienced GEM hacker, of course, it's
all pretty obvious. Took me a long time. Of the two supplied icon
editors, only one is useful (the other is just too primitive), and even
it has a few annoying bugs - I could never get it to save both an icon
and it's mask in one file... but maybe that's me & not it. Bets,
anyone?

Flop 5 - Emacs, various source and a doc file

Well, lessee - Doodle (again), a demo of how to use the forms
library, a copy of a very early Mark Williams Co. emacs, and a tutorial
doc on how to read/write floppies by directly twiddling the WD1772
(which, by the way, appears in printed form in the pile of paper...).
The emacs I considered a great thing, since I use it on Un*x all the
time (I'm in it now, as a matter of fact). The rest is nice to have,
although my criticism of impenetrable Alcyon style still holds. To bad

they didn't give source for the emacs, though.

--

And that's it. There's no shell supplied, instead they have an incredibly klugey 'batch processor' to invoke the various & sundry programmes required to do anything interesting like, say, getting a compile-and-link done. No RAMdisk to help speed things up. The real prizes are the ICED icon editor, the RCS, and the emacs. The Alcyon C compiler, the assembler, linker, and libraries are a disaster. The debugger is ok but primitive. The source code is good but obscure because of the Alcyon bug-workarounds (or lack-of-feature workarounds).

Now, having waded through all this p*ssing and moaning, what would I recommend instead? For a start, go out and get a copy of the Mark Williams C package. Not too many bugs, nice Un*x compatability libraries, ok shell & tools (you know, stuff like egrep and tail and wc), source for an emacs, pretty good (but not quite complete) GEM and VDI docs, and a RAMdisk. In all, not a bad package deal. I have hacked on it pretty heavily and like it well enough. Secondly, get a subscription to START Magazine (with the disks!). Thirdly, get ahold of the Proffesional GEM series by Tim Oren - this is a must have. I don't know about a Resource Construction Set, though; we're using DRI RCS 2.0, but maybe you can get a copy of the KUMA version. And I'm still looking for a really good icon editor. I also recommend GULAM, and the ZMODEM that was posted about 6 months ago. Or Uniterm - that's a good solid piece of freeware too.

Short list of things to stay away from: any of the bloody useless Abacus Software books (except maybe vol 13, "ST Disk Drives", which is almost useful). These things are just copies of the DRI stuff, with gratuitous errors added to avoid copyright infringement :-(

Any other suggestions from the other hackers out there? I want to get down off this soapbox, my feet are tired :-)

Yep, I got the Zoomracks II version while at Comdex over a year
ago...it lets you store degas pictures as part of your
datasets...among other features.
>
>Why hasn't this product come to light earlier? One thing I did notice was
>that the screens used in this article gave a definite edge to Hypercard
>since there were beautiful graphics mixed with text. Is this a shortcoming
>of Zoomracks?

Yes, and no...It depends upon how much you really depend on graphics.
I like the Zoomracks approach because it got more information on the
screen at once (although it looks like a mess if you were expecting
graphics.) But then, I also am the type of person that turns off my
icons on the ST display and just use narrow vertical boxes of text
file names for my desktop view (to see more files). From a programmers
point of view, I still have yet to come up with a use for hypercard
(I've played with it and am not impressed enough to upgrade my wifes
Mac just for that). Zoomracks II seems to have a lot of power and
macro programmability to it, but give a person a good database, a good
spreadsheet, and a good word processor and they will probably be more
happy in the long run.

I know that a lot of the MCC people down in Texas are doing Hypertext
based applications (which hypercard was derived from). It would be
nice if they tried porting some of their stuff over to the ST's (they
are currently SUN and Symbolics based.) I think the Mega's would make
a nice engine for their needs (and things like the ABAQ would fit into
their longer term AI stuff where they are really going to need the
horsepower). If I remember right, MCC stands for Micro-electronics
Computer Consortium and is a research organization funded by 20 or so
large companies in the US to develop new technology in a variety of
computer and IC design specific areas...

952. Print Master icons -- what is PD?

Newsgroup: comp.sys.atari.st
Date: 1988-01-01 16:28:55 UTC
From: silvert@dalcs.UUCP
Message-ID: <2755@dalcs.UUCP>
Source record: 255252

It is clear from recent mail that I have received that commercial PrintMaster are getting mixed up with PD icons. Since I run a BBS this is something I have to be careful about, and I thought it might help to identify the three commercial libraries that I am familiar with. Here is a list of the first 4 icons in the three library disks published by Unison World. If you have a library that begins with these icons, it is probably pirated.

PrintMaster, usually called SLIB or STANDARD library:
Christmas Tree, Menorah, Cake, Easter

Art Gallery I, usually called ULIB
Santa, Snowflake, Star of David, Black Cat

Art Gallery II, usually called GALLERY2
Snow Scene, Conductor, Crown of Thorns, I Forget

I don't have the commercial Fonts and Borders disk, so I can't comment on what is PD in that area.

To tell the truth, the Art Gallery series is pretty crummy, and the PD libraries are better. I bought them cheap and still felt ripped off. However, copyright is copyright.

[]

I wonder: is the 18 inch limit on the length of the cable connecting the ST to the Atari SH204 hard disk (stated in the user manual) the real technical limit? Would be very nice to have a, say, 3 feet cable. (I hate fan and motor noise.)

Does anybody have a disassembly of AHDI.PRG? I have a strange bug, and suspect that AHDI.PRG fiddles with high RAM. Could that be? Is there an alternative driver program for the Atari HD?

- Moshe Braner

PS: how can I persuade PC-Ditto to read partitions D: and E: from inside MS-DOS? I am trying out PCD 3.0 on 1040ST, mono, SH204 HD, and _did_ put "device=pc_dhd.sys" at top of config.sys. "Dir d:" prints either garbage or an empty list of files. The PCD docs say that reformatting the HD is _not_ required (unless you want to autoboot MS-DOS from the HD, in which case you must let MS-DOS reformat partition C:). Partition C reads OK (and I did not reformat it).

957. Re: speeding floppies?

Newsgroup: comp.sys.atari.st
Date: 1988-01-02 09:43:43 UTC
From: dsmall@well.UUCP
Message-ID: <4884@well.UUCP>
Source record: 255257

In the referenced article, there's much discussion about speeding
up floppies from Michael Stein.

There's no point in using a disk with interleave on it on the ST; the
ST is more than capable of 1:1 reads and writes. Since the ultimate
limiting factor is the head rubbing against the media at a certain speed,
and the ST is doing r/w as fast as physically possible, there's no
possible gain there.
It is dangerous to remove the seek verify bit in the manner you have.
Let's say you step to a new track. The head rattles back and forth
awhile as it settles. During that time it is reading well enough to
return track dta to the controller, yet the head is still wobbling. If you
try a sector write, which lasts 16 msec, during this time, it's written in
a yo-yo pattern on the disk -- and is often unreadable the next time.
This comes from hard experience; I did this on the Magic Sac Motivator, and
could consistently kill the first sector of each track. Weird, but true.
You're right that a full disk rev is saved. A better way is to just twist
the track two sectors around, leaving one sector (#9 or 10) for the settle
time and one sector (#8 or 9) for the seek verify. Then you don't lose any
time at all track to track, and keep full compatability with unmodified
ST's. That's how we did Twister.
As for using the index pulse as the delay time for seek, well, maybe. On
9 sector tracks you'll get away with it.. remember, 16.667 millisec per sector.
On 10 sector tracks you won't, there is no room. But worse, the step only
happens on the next-sector-read command, which may take awhile to
happen, all of which time the disk is spinning.
Since you're stuck with 30 msec head settle, and lots of machine have
seek-with-verify, I think it's the optimal solution to twist the track by 2.
You just can't physically get data off multiple tracks any quicker without
speeding up the RPMs of the drive.

.. perhaps we should plug it into a 220 Volt outlet?

I think you're confusing interrupt processing with full multitasking. One question you can ask yourself is: Can I run more than one program from the same microprocessor? Or can I interchange programs between processors? The answer: NO. Each chip is only capable of dealing with one task at a time, and only a task specific to that chip. A real multitasking machine can have the microprocessor (e.g. 68000) deal with more than one task on a revolving basis, using priorities to see who gets more time, without having to wait for each task to finish completely before starting the next one. If the computer isn't too slow or weighted down (with tasks), this can appear to the user as if each task is running at exactly the same time.

If you want to call interrupt processing multitasking, then of course computers have had it for many years, but it definitely isn't the kind that's going to, by itself, allow you to run more than one of your favorite applications at the same time.

We are huh? Right now I'm cooking dinner, typing on my computer and
listening to Prairie Home Companion on the radio. Sounds like multi-tasking
to me.

Don't forget that users who are running a single program could very well
be multi-tasking and not know it. For instance, color-cycling in
Graphic Craft spawned a subtask and operated independently. I believe that
Word Perfect's printer module is a separate program from the editor, at
least on the Amiga.

Pinouts on chips are not exactly free; they have a definite
manufacturing cost and per-connection reliability implications.
Engineers spend quite a bit of time juggling this scarce and valuable
resource (the pins) amongst all the possible things that they might
wish to ship in and out of the package. Hence all those bl**dy
multiplexed address/data schemes on cpu's (almost anything from Intel
last time I looked), multiplexed addresses on DRAMS, kluges to
redefine pins according to system configuration (Intel again, at
least on the 808[68] parts), and ghods know how many other egregious
hacks over the years. I mean, most engineers understand the KISS*
princple, and they don't design these horrible interfaces just for
the joy of complexity [well, most of them, anyway; I have dark
suspicions...].

So let's not be _too_ critical of Jay - your other examples were
much more convincing. My pet peeve is that the Atari people didn't
put a base-and-limit register into the big glue chip that controls
the memory array(s) on the ST. If I had base and limit registers, I
could get true, transparent multitasking up on the ST (which, of
course, Dave Meile could ignore; that's his privilege).

Dear sir.
I own an Atari 1040ST and I would like to try using it for image processing in cardiology. I need a video digitizer which will be able to digitize stop-frame video tape pictures (not video camera), and be compatible with the video standards PAL, NTSC, SECAM, colors and/or black and white. Apart from obtaining the pictures on the monitor screen, I am interested in getting numeric picture files of 8 bits for each pixel. I would appreciate if you will be able to find out for me information on the above subject, be it available commercial devices, electronic kits, tested circuits in data sheet form or BITNET addresses of ST users successfully employing such digitizers.
I am looking forward to your answer.

Sincerely yours

Dr. Ron Leor,
The Heart Institute,
Sheba Hospital, Tel Hashomer,
Tel Avive, ISRAEL.

(and many other contributions)

I think that there is an aspect of this argument which seems to have escaped many contributors: a good multitasking operating system gives the user *far more* than merely the ability to launch more than one application at a time.

Principally, the application designer is able to design multitasking applications which use daemons for part of their functioning, but appear to the user as single programs, just cleverer. We all use these facilities in Un*x without thinking about it (cf. elm), but for the software designer the benefits are cleaner design of complex programs, and for the user a nicer, cleverer application (spool printing, concurrent messaging, simultaneous computation and display in complex graphics applications, etc etc).

The bottom line here is that the *average user*, if there is such a person, does not have to bother to understand, or even know he is using, a multitasking opsys to benefit from it.

966. Re: eproms burners

Newsgroup: comp.sys.atari.st
Date: 1988-01-04 16:07:21 UTC
From: edo@cblpn.ATT.COM
Message-ID: <534@cblpn.ATT.COM>
Source record: 255266

I don't have any recommedation on which EPROM burner to buy, but I DON'T recommend the HIPPO eprom burner. I have one of those - it seems to work reasonably well with EPROMS with a 21 or 24 volt programming voltage (2732, 2764) but the 12.5 volt chips (27256, 2764A, 27512) don't work. By the time I had discovered this, the device was out of warranty. There is no schematic included in the documentation, so I can't be sure, but I think the problem revolves around the Vcc (supply voltage) to the EPROM. On many EPROMS, such as the 27256 and 27512, the supply voltage is supposed to be raised to 6 volts when programming the chip. The Hippo programmer doesn't appear to do that. Anyway, I have NEVER been able to get the thing to reliably program a 12.5 volt eprom - sometimes it will program PART of the device, sometimes it won't. The interesting thing is that it often shows verify failures on locations which subsequently prove to be correctly programmed.

The opinions expressed herein are my own, and do not necessarily reflect those of AT&T Bell Laboratories or Advanced Programming Resolutions (my real employer).

There are at least two alternatives; the Supra driver and the ICD
driver. Both have been freely distributed on Compuserve.

> PS: how can I persuade PC-Ditto to read partitions D: and E: from inside

> not reformat it).

From messages on Compuserve, there are apparently some fields in the
boot sector that are "don't care" to the Atari driver, but are looked at
by IBM drivers. Avant-garde is distributing a patch program via Compuserve
(and presumably others) that zaps these fields from the garbage that they
are left at by the Atari formatter into something that MS-DOS approves of.

From: ftw@datacube.UUCP
Message-ID: <105100045@datacube>
Source record: 255270

Anyone have/know of a good memory testing program for the ST? I just put the Tech Specialities board in my machine this weekend, and it seems to run fine. The memory test they provide is a joke; it is in BASIC, and simply does peeks and looks for 255 to come back, indicating a bus-error. Thanks in advance.

Sorry. The blitter ROMs do not have any changes to the 40-folder limit.
The next ROM rev should take care of this, but it won't be done for a while.
The article must have been written before the ROMs were frozen.

Will do, but I have logged in to several STadel boards and still haven't changed my opinion. Maybe the reason you find them more friendly now is that you've had 6 months of experience!

OK, I'll buy that part. But you can't leave messages "TO" a specific person.

> If you could reserve say three of your systems for downloading

Based on the current usage, I'd have to set up 4 for downloading and 1 for messaging. But, I am philosophically opposed to that -- I think it would reduce message traffic. Some people call mainly to download but also read the messages. And messages are my primary reason for having the board.

Hmmm... maybe I should go with STadel... it would cut down the downloaders :-)

From: HEART01@TAUNIVM.BITNET
Message-ID: <8801042017.AA02016@ucbvax.Berkeley.EDU>
Source record: 255279

Dear sir.
I own an Atari 1040ST and I would like to try using it for image processing in cardiology. I need a video digitizer which will be able to digitize stop-frame video tape pictures (not video camera), and be compatible with the video standards PAL, NTSC, SECAM, colors and/or black and white. Apart from obtaining the pictures on the monitor screen, I am interested in getting numeric picture files of 8 bits for each pixel. I would appreciate if you will be able to find out for me information on the above subject, be it available commercial devices, electronic kits, tested circuits in data sheet form or BITNET addresses of ST users successfully employing such digitizers.
I am looking forward to your answer.

Sincerely yours

Dr. Ron Leor,
The Heart Institute,
Sheba Hospital, Tel Hashomer,
Tel Avive, ISRAEL.

980. SH204 disk errors

Newsgroup: comp.sys.atari.st
Date: 1988-01-04 21:09:53 UTC
From: hcj@lzaz.ATT.COM
Message-ID: <46@lzaz.ATT.COM>
Source record: 255280

There have been many posting with regard to strange ST behavior
when using the SH204 disk.
After discussing this with Chris at BMS I learned the following:
1. SH204 seems to report 8 drives per controller. I saw this with
the BMS driver on my SH204. Also Magic -Sac describes this.
2. That isn't the problem.
3. SH204 CANNOT report ANY ERROR to the computer.

So why doesn't everyone die on a disk error? The Adaptec interface
does the retries, and if successful, all is well. What happens
if the sector is BAD? You read in junk, fail to get the error message,
and see strange things.

BTW, hdx CANNOT mark as bad the blocks in the root directory or the SAMS.
This creates really strange problems when a block changes, as when
adding files and suddenly 5 megabytes dissapper.

I solved my problems 2 ways.
1. I changed hdx to accept a list of bad blocks and let Adaptec remove
them permanently.
2. I now use a BMS controller. Highly recommended.

Any one want to buy a slightly used SH204?

981. VCR -> Atari color monitor

Newsgroup: comp.sys.atari.st
Date: 1988-01-04 21:42:51 UTC
From: engst@batcomputer.tn.cornell.edu
Message-ID: <3278@batcomputer.tn.cornell.edu>
Source record: 255281

Having taken a fair amount of flak from several people who seem to think me stupid because some site truncated my messaged, I will ignore them and ask again. Does anyone know of a cable or interface box which allows one to use an Atari ST color monitor (SM 1224) to display VCR tapes, movies etc? It seems that there should be such a beast, and Allan Pratt agreed with me, but neither of us has yet found one. Essentially, it would have to allow composite output to be displayed on an RGB screen, something which should be possible. This would allow you to have a VCR, which has a tuner and all that sort of TV stuff built in, with your computer monitor, which lacks all the TV stuff but can show a decent picture. Please send all information to me and I will summarize to the net.

Thanks - Adam

982. LSC, function pointers, and segments

Newsgroup: comp.sys.atari.st
Date: 1988-01-05 00:29:25 UTC
From: gardner@prls.UUCP
Message-ID: <8217@prls.UUCP>
Source record: 255282
Cross-posted to: comp.sys.ibm.pc,comp.sys.mac,comp.sys.atari.st

I started working on segmenting a large program that uses function pointers rather extensively and got worried about assigning a function pointer in one segment, unloading that segment, and having it accessed later from another segment. Is the function pointer still valid?

Interestingly, when I step through the code with TMON I noticed that when the function pointer is used it is called via JSR (A0), as expected, but the next function called is something like JMP xx(A5), which is usually the type of call you see in the jump table for a loaded segment, which is replaced by _LoadSeg if the segment is unloaded. (I haven't yet had time to see what it says when the segment is unloaded.)

So, it appears that the function pointer should still be valid, even if the segment containing the function gets unloaded. I would like to know if this is true, even for static functions, and if so, what kind of magic makes it possible.

Thank you,
Robert Gardner

I am trying to use the alcyon compiler. (I know big mistake)
I heard a while back that some one at atari was developing patches to
ensure that the different passes would return a code other than 0 if
an error occured during that pass. My question is

Was this real or another piece of rumorware.

If the answer to the question is rumorware then send petitions to
the folks at atari for a hurried implementation of the above, if reality
then please send me the patches so that I don't have to sit here with
my hand on the ^C key.

Thanks.

I have made UniTerm v2.0a (currently 006) available for anonymous FTP on our host cs.orst.edu. This machine is on the NSFNET, which means that it's not unusual for it to be unreachable on occasion. As usual, please limit access to after working hours.

The files are in the directory pub/atari/uniterm, and you should probably get "README" first to see exactly which files you want.

And if you like UniTerm, you should send Simon a check. I hear he's saving up for an Amiga (I know I'll regret joking about that -- more likely he's saving for a color monitor)....

>address to contact for these items. I have mailed to the address
>three times, with never a response.

There is currently a large (no kidding) backlog of mail waiting at
the UUPC request mailbox here that I can certainly use an extra half-time
staff to help sort out if someone would like to fund that. :-)

Seriously, the backlog we currently have is large, and we don't like it
that way, but we can only do our best with the limited time we have got.
(And the time we spent on mail only takes away from the little time we
have got to try to prepare the next release with.)

I don't like to complain, the response we have been getting for UUPC has
been fantastic, and we love it, but there is only 24 hours to a day
and there are a lot of things that we have to squeeze in there. UUPC
had been a spare time project for all of us, and will likely continue to
remain so... (unless, again, someone want to fund this "research")

>Now, how can I get my hands on this without pulling my own teeth?

If you can't do BITNET nor ARPAnet FTP, then the options I can currently
think of are:

1) directly UUCP it from van-bc
2) find a nearby comp.sources.misc archive
3) find someone else that has it

Having us mail out the UUPC distribution by e-mail is definitely NOT
an option, as we could not abuse our UUCP neighbours nor could we
afford the real $ cost of sending such large files out via UUNET a few
times a week. So, please save us all some trouble by not asking for
the impossible. Thanks.

My original posting did not make it so here it goes again...

I am looking for a program that will take an atari picture
(.pi1-3, .neo, etc...) and translate it so that I could use it as a
backdrop on a SUN terminal. If the SUN terminal is bitmapped similarly
to the atari st there shouldn't be much of a problem, right?
If anyone has the program that I just mentioned or any
information about how I would go about writing the program, send me
mail. Thanx in advance.

From: NETWORK at FRSAC11
To: INFO-ATARI16 at SCORE

Lately I had to use MCC Lattice C 3.04...

I would use the forkvp() call, but when I try I get 3 lovely bombs on my screen, and it is ruining my whole evening.

Can some king soul talk to me how to do a successful spawn in Lattice ? In MWC I do a Pexec and it is running, but I would prefer use a more straight UNIX formalism, and do a fork() or an exec(). (I know the semantics are not the same at all, but I am only interested in maintaining a portable coding, and accept the GEMDOS restrictions...)

More on the subject: what do I have to do to transmit to the Pexeced process a nice environment ? (The doc I have on GEMDOS does not talk environment about Pexec.) Is the thing set up for me in the child basepage by Pexec ? or what ? (I *need* to transmit a nice environment.)

Please help my code.

Have a better year.

If you mean something to convert Neochrome pictures to an IBM format,
I'm not sure. But, if you mean "is there a common format" then I
suggest you have a look at the GIF standard developed on CompuServe.
They have documents generally available which outline how it works,
and if you need sample code you can become a GIF developer. There are
also GIF encoders and decoders for most machines which can be
downloaded. The GIF standard includes compression, so that most
pictures become smaller. However, the display program I have seen
for the ST is a little slow at putting up the picture.

Not sure if this is what you're looking for, but here goes:

Supra is working on a frame grabber for the ST. I saw a working prototype of this at Antic. Very impressive. It works at 25 frames per second (compared to one for the *m*g* which goes at 15). In the demo I saw, it would display an image coming from a video camera, so I assume a VCR would work as well.

The frame grabber includes software for all kinds of special effects -- you can superimpose computer images, or even have the computer control specific colors (like, smear the blues but nothing else). The frames can go into the computer's memory, which gives something like 5 seconds of video stored in a Mega 4.

According to Mark at Supra, it looks like this will be out Real Soon Now. Hope to get one to play with myself.

995. Summary of disk drive information

Newsgroup: comp.sys.atari.st
Date: 1988-01-05 21:07:44 UTC
From: engst@batcomputer.tn.cornell.edu
Message-ID: <3287@batcomputer.tn.cornell.edu>
Source record: 255295

Well, the information on various disk drive has subsided, so I'll post the entire archive in another posting. To recap: my drive started to give write errors, often even refusing to boot. I tried tightening all the connections and making sure the chips, most notably the DMA chip were seated. Everything seems to have failed. I now have to possibilities. I can (a) take it to a repair place 2 hours away, which would be rather difficult since I work full time during break and don't have a car most of the time. On the other hand, I could (b) just order a new IBM style 3.5" drive and hope that it works. I have decided to follow the latter route for several reasons. First, I can always use the second drive even if it won't work internally. Second, I'm planning on getting a BMS board set and Seagate 238 30 meg hard disk as well, so I'll have a power supply and case handy. There also a few possible problems with this route. The drive might be too big, or might not attach correctly (I asked about the screw holes and it, a Fujitsu, does have them.), or it might not have the correct input/output for the write-protect sensor. To protect myself from that possibility, I ordered from a place that offers a 15 day refund policy. As far as the hard disk goes, BMS has been highly recommended and I see no reason to go with ICD instead since it sounds as if they merely copied the BMS board and made few improvments. I don't mind minor hardware jobs, and the BMS board set sounds fairly easy to assemble without soldering and all that hard stuff. (I don't want to buy the Atari or Supra drives because of minor problems like size, cable length, potential reliability problems etc. I also think it will be fun to put everything together.) The Seagate drive is cheap and basic and 30 meg, which is better than the Atari-specific drives for the same size. So, my system should end up looking like this.

DS/DD internal floppy (Fuijitsu - IBM-style) $115
DS/DD external floppy (old internal drive $000
used only for reading)
needs a cable from E. Arthur Brown $35
BMS board set $250
Seagate 238 30 meg hard disk $275
Power supply and case combo $80

I'm only actually buying the new internal drive for now - I have to get the ST working well before I invest any more money into it and I still don't know for sure that the DMA chip isn't the culprit.

Adam

Thanks to all of you who sent information or offered help in one way or another. Luckily I didn't lose anything in the whole mess and I've sort of enjoyed the research I had to put in to finally decide. If anyone has any major problems with what I've decided, please feel free to tell me; I'm

still open to suggestions.

From: braner

Hi!

Sorry to hear of your problems. I have always worried about that happening
to me, with the 1040 having only one drive that I excersize a lot. I have
even thought of buying an external drive just too have a spare.

Now that's my suggested solution: buy another drive. Fix the old one later...
You don't have to buy a complete Atari ST type drive, with case and all.
Just get the standard DSDD 720K drive that they now sell for attachment
to IBM clones. They sell for about $130 mail-order. From what I've heard,
they are pretty much standard, including the connectors in the back,
but not so in the location, shape and size of the disk-eject button.
But you can enlarge the hole in the ST case... (or keep that drive outside
of the ST case).

I forget if I told you, but a few days ago I bought Dale's last hard disk,
an Atari SH204 (20 megs). So now my floppy drive gets somewhat less use.
Do you have by any chance a copy of the program that makes the ST boot
from the hard disk? Needless to say, it (and FOLDRxxx) did _not_ come
with the drive...

Good luck. If you find a good solution, tell me.

- Moshe

From: Gerry Wheeler <wheels@mks%math.waterloo.edu>
Subject: disk drive help

I dunno about that. I think internal connections may be your best first attempt. Mine went away with similar problems. I took it apart and fiddled with it, and finally it fixed itself. Unfortunately, I never was able to determine the real cause, but I suspect a bad contact on a chip pin. Remember when people used to recommend the 4" solution (drop it 4" onto a desk top)? That is the early cure for this problem. I recommend opening it up, prying out socketed chips, and using lots of contact cleaner.

From braner Tue Dec 15 10:40:43 1987

Hi.

A 3.5" DS drive, just bare drive, costs about $120-140 in the ads in the back of BYTE. Power-supply I'm not sure how much, personally I would get a cheap 12VDC plug-in sort of thing, and add a little 3-pin 5V regulator chip. Radio Shack was selling, for $5, surplus Coleco Adam power supply modules. They give 12V and + and - 5V. Real good buy - I bought 2! See if they still carry those. Good for lotsa uses (but NOT big enough for a hard disk...). I don't know where would you get a suitable enclosure for the drive, though. Must be around somewhere. Then you need the cable, with the wierd ST plug (VERY hard to get). If you can get the whole works for $200 it's probably the best way to go. All that's assuming you want to connect it as a 2nd drive, not just keep it on the shelf as a spare.

With hard disks becoming so cheap, you could consider that too. I saw some mail-order ads selling ST HDs for < $600.

From: rochester!rutgers!bu.edu!brianb@cornell.UUCP (Brian Bresnahan)
Subject: Re: general info on disk drives wanted

I own the Atari SH204 and while it may be big, it is quite reliable and quiet, I have been running a bbs on it for over a year now and it has not been shut off for more than a week total.

When looking for a hard disk, Astra has a nice reliable system that includes a floopy drive, i would tend to avoid the supra models under 30 meg because there have been problems with reliablility. Or you can build one yourself, there is a California company that sells the interface, it would be large, but you can build it any way you like(number of drives, sizes etc.)

From: mpsimon@phoenix.Princeton.EDU (M. Patrick Simon)
Subject: Re: general info on disk drives wanted

Adam Engst--

I have been waiting for the ASTRA hard drive/floppy system to come down in price. I am very impressed with the system. I saw one demo'd at a recent Atari fair: the man was rolling the thing around, while at the same time, a demo was running on the ST, reading pictures off the hard disk and displaying them on the monitor. The system comes with a one year warranty. Unfortunately, it is still way out of my price range (list price $995.00, I have seen it for as low as $850).

I have seen ads recently for a two double-sided floppy drive. I am not sure how this works with the ST OS (is it as easy as install disk drive?). You might also want to find out more about the Berkeley Micro Systems boards which are supposed to turn the dma port into a scsi port. I can try to find more specific information on either of these if you are interested.

Good luck. Please post to the net whatever info you find out, or at least save your messages in one big archive and mail me a copy in a few weeks.

From: dragon@olivej.ATC.OLIVETTI.COM (Give me a quarter or I'll touch you)
Subject: Re: BMS controller package

Adam, I'm using a BMS controller with a Seagate ST251. No problems encountered. The BMS+Adaptec controller combo is $250, I believe. One just hooks everything together, and runs the software. Pretty foolproof, as long as one sticks to the hard drives listed in the documentation (which covers quite a few hard discs). Being an officer in our local Atari group (which is close to BMS) I've met Chris and have worked with him at shows. He's quite helpful in setting systems up when a customer has problems. (Chris is the president of the company.) If you choose to go with the board, I believe you'll be most happy with it!

From: Lee Dickey <ljdickey@water.waterloo.edu>
Subject: Re: general info on disk drives wanted

I have heard of people using the BMS controller, and I think that I saw a posting on the net about that controller, about a year ago. I do not *know* anyone who has one. The article mentioned hooking up a largish

disk that was "surplus" around the shop.

When I was a Case Western Reserve, Mr. Bammi showed me the inside of a 20 Meg hard disks. It had a gray plastic box with the name Atari or Supra on the outside. Inside, there two things: one was a small printed circuit board and the other looked like it was a refugee 20 Meg hard disk from an IBM PC.

The Atari Twist:

With two hands, one at each end of the keyboard, pick up the unit until it is about two inches above the desk. Rotate one had forward, one hand backward, so as to "flex" the case. Do the same thing in the opposite direction. I guess this could move chip pins in their sockets.

Variation:

Drop the unit to the desk top. I do not recommend this. This might have the same effect as pressing chips into the sockets.

****

From: umn-cs!viper.Lynx.MN.Org!john@cs-gw.D.UMN.EDU (John Stanley)

Hello Adam. I've had problems reciently very similar to the ones you described, so I may be able to help... I'm going to give you more than one suggestion. You should probably try the 2nd suggestion first because it doesn't require doing anything but booting a disk.

The problem with my system (same configuration and machine as yours) turned out to be a bad DMA chip. This is one of the chips that, fortunatly, Atari put in sockets in all the STs I've ever heard of. The cost was around $50 to have it replaced at my local service center.

The first thing to try is the "drop fix". Take your machine, lift it about 2-3 inches above the table and drop it. This offen has the desired effect of reseating loose chips.

If that doesn't work, try booting a ramdisk. You did mention that you can occasionaly get a disk to boot. If so, you may (with -lots- of patiance) be able to get a ramdisk program to boot. Once this is done, you then can probably get your text files moved to the ramdisk although you should check the files for glitches. If you can get this far, you can probably take a 3.5in disk (formatted on an IBM) and get copys of your text files copied to a form an IBM-PC can use.

If that doesn't work, you can try removing the top of the case and looking for a single large socketed chip normaly found under the internal disk drive. VERY gently, pry both ends of the chip up about 1/32 of an inch and then push it back into the socket. While you've got the case open, it wouldn't hurt to loosen and then then reconnect the cables to the drive (be sure to try both ends)...

If that doesn't work you can, if you want, send me the disk with
your files. I'll copy them to an IBM format disk and return them.
(This is obviously a last-ditch suggestion, but if you really need
the files, I'm willing to go this far to help.) If you decide to go
this route, please be sure to specify 3.5" or 5.25" IBM disks. The
3.5 inch size is obviously easier, but I can if necessary drive about
15 miles to a friends place to get files onto a 5.25" disk.

Please let me know how this turns out.... Good luck..

> hardware, power supply, case, etc is needed)? Thanks . . .
> Adam
> engst@tcgould.tn.cornell.edu

I built my hard disk system this way because I already had most of the
parts. If you're going to buy everything from scratch, then the cost
may exceed that of the commercial hard disks. However, the home-built
type may be more flexible.

All the hard disks work like this: (this paragraph is open to correction
by more knowledgeable people!): the DMA output of the ST, known as ACSI,
feeds to an adapter board. This board converts the protocol to SCSI, a
standard disk interface protocol. The SCSI cable connects to the disk
controller. The Adaptec 4000-series controllers is usual. The
controller then connects to the disk. If you look inside the commercial
units, I think you will find this arrangement packed in there.

The disk drive can be almost any unit that uses the st406 or st512
interface. (Is that the right number? Anyway, same disks used by IBMs.)

You may be able to use a disk with an SCSI interface by omitting the
Adaptec controller, but I haven't seen it done.

By the way, the BMS adaptor board includes a battery operated clock,
and I haven't had to set the time since I put it together.

So, total parts are: ACSI cable from ST to adaptor, adaptor board
($140), 50-conductor SCSI cable to controller, controller board ($125?),
34- and 20-conductor cables to hard disk, disk ($300?), power supply
($50?), cabinet.

As mentioned in the posting, adaptor boards are available from Berkeley
Microsystems. I have also seen the adaptors from the commercial drives
available. Adaptec controllers are available from BMS and others.
Power supplies and cables can usually be found locally.

By the way, the Adaptec controller will support 2 hard disks. They must
be very similar, as there are some jumpers on the board which affect
both drives. Just make sure your power supply has enough reserve if you
plan to go this route.

My system started out as an outboard drive for IBM PC's. It included
the Adaptec controller (possibly damaged), and an Ampex Pyxis 13 10-meg
disk, and a blown power supply. I added a new supply, had the
controller checked out by Adaptec, bought the BMS board, and voila. I
have since upgraded to a Seagate ST238 20-meg drive, and I have enough
space and power to add another. (That's what I meant about being more
flexible.)

If seeing the insides of a computer makes you queasy, don't go this
route. If you think you can plug things together, this may be for you.

unless I'm sadly mistaken (and often I am) the BMS board set allows you
hook up any ST506 or ST224 (also mistakenly called SCSI) style disks to
the ST. The board set will work with disks with or without builtin SCSI
controllers. I presently use a single 64Mbyte disk with my BMS board set
but in the past I have hooked up 2 drives to the same board set and it worked
with no problems

I have tme BMS controller. It works fine (once we found the bugs but
that was almost a year ago). The only question I have about it is does
it actually cost less. You need to buy the interface and controller
($250, I think), then get a drive, box and power supply.
No problems putting it together but when you are done you probably
could have bought a Supra or Atari drive.

I have seen the various replies to this original query and am amazed that
nobody even mentioned an alternative to BMS. Well... here goes:

Being the owner of two BMS kits (one for a Micropolis 1325 on a 1040, and one
for a Seagate ST506 on a 520+), I have seen how Berkley Microsystems has
improved over the last year or so. I think their present-day package is well
put together and easy to build. I have only had two reservations about the
kit: 1) The non-standard format used on the disks, and 2) THAT SHORT CORD!!

Until a recent (fairly) Atari Fest in the area, I was under the impression
that the BMS kit was the only one out there. At this fair, I was introduced
to ICD, Inc. (I don't know what it stands for.) and their ST Host/Controller
Kit. Among its advertised features are:

- built in battery backed-up clock
- 7 SCSI devices and daisy chaining
- 100% compatible with Atari and Supra
- built in verify and error retry

They answered my "short cord" problem with their three (3) foot cord!
Anyway, I was quite impressed with their presentation and brochures.
(If only I had known about them earlier...)

Finally, I'm not really knocking BMS. I'm letting you people out there
know there is an alternative.

From !seismo!uunet!mcvax!diku!iesd!judas Mon Dec 28 13:43:35 EST 1987

This is partially a retransmission of an earlier posting, but since I'm
not sure that the first posting got around, and there's been some talk
on the subject since then, here goes again.

In message <236@xrns.UUCP> Tom Love writes:

>hello out there... i hope i am not adding to the clamor of people
>crying out for help with 5.25" drives; this is actually a different
>question. i would like to have an external 3.5" DSDD floppy drive
>to go along with the one already inside my 1040ST. i do not, however,
>desire one bad enough to pay the $200 plus which atari dealers seem to
>want to charge. i do not mind a little hardware hacking, and don't
>mind scabby looking assemblies with wires hanging out all over them.

In message <8712211937.AA0147@ucbvax.Berkeley.EDU> Gregory Welych writes:

>I have had one of my disk drives die on me, and rather than try to get
>it fixed, (it was only a single sided drive anyways) I decided to
>buy a cheap(er?) double sided drive. I hooked the new drive into
>the little converter card inside an Atari drive, and connected
>the power supply up. It works fine except for one slight problem

> Say I boot up with disk A in drive A, and disk B in drive B.
> (drive B is the new drive)
> Then after I get the desktop, I change drive B's disk to disk C.
> (I have a window automatically opened for drive B on the desktop)
> Then I hit ESC to get the new directory, but it doesn't know
> I changed the disk. I am assuming that the disk drive has not reported
> media change to the ST so it doen't think that there might have been

> a switch.
>
>Now to my main question:
> What in the Atari drives senses the change of media??????????!!????
> And how does the drive signal this to the ST?????
>
>Thanks in advance for any help,
>
>Greg Welych.

A couple of months back, my 1040ST suddenly blew its internal doublesided floppydrive. Since this was the only drive connected, it was a disaster ! My beloved Babs was (almost) dead. She would eventually boot, and come up with an empty desktop. That's a boring game (it wasn't so :-) at the time). What went wrong, I don't know, I tried plucking everything apart to check for any loose connections etc., but no luck. A custom chip in the drive did get awfully hot though.

To summarize, I found myself in a situation somewhat similar to yours: I had to get a new drive somehow. Not wanting to pay for an original Atari-drive, I came up with a reasonably cheap solution. A little research revealed that the internal drive used a standard Shugart interface (both in terms of signals AND connectors). So the problem could be reduced to finding a (cheap) bare drive equipped with the Shugart interface. That's easy enough. I picked a NEC-drive type 1036A, a drive known for its reliability and quiet operation. It's also smaller than the original Ataridrive (which seems be from Hitachi), so with a little fiddling I managed to get it crammed into place. (I had to make some minor changes to the ST-case). The proof of the pudding ? Well, I removed the old drive, plugged in the new one, turned on the power, and Babs made a successfull boot from disc and has been happily humming ever since.

So to connect another external drive, all it seems one has to do is:

A) Buy a bare drive.

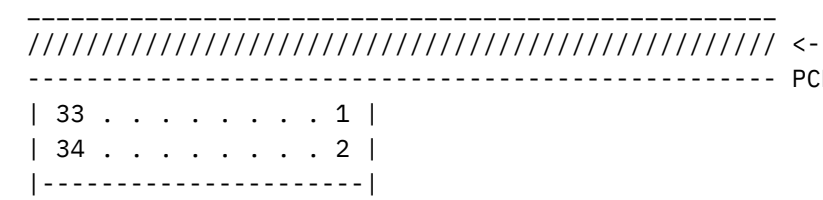
B) Pick up the floppysignals from the ST's external floppy interface. The connections are as shown (seen from the rear):

11 10 PIN SIGNAL INPUT/OUTPUT
1 read data i
9 8 2 side select o
13 12 3 gnd n.a
7 6 4 index i
14 5 drive 0 select + i
5 4 6 drive 1 select + i
7 gnd n.a
3 2 8 motor on o
1 9 direction o
10 step o

11 write data o
12 write gate o
13 track 00 i
14 write protect i

+ : On the 1040's external floppy interface, only the drive 0 select is
active. It carries the actual drive 1 select signal. That way
the external drive automatically becomes drive B.

The standard Shugart interface (again as seen from the rear) looks
like this:

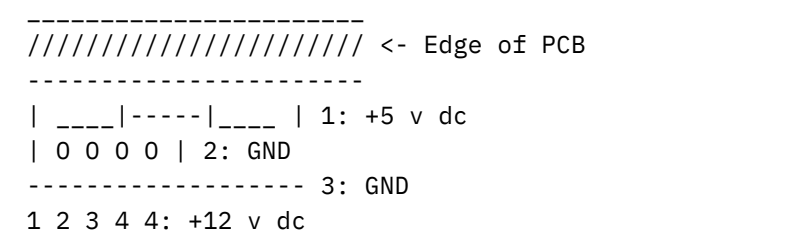


PIN SIGNAL INPUT/OUTPUT PIN SIGNAL INPUT/OUTPUT
2 motor on 1 * i 18 direction i
4 in use * i 20 step i
6 drive select 3 * i 22 write data i
8 index o 24 write gate i
10 drive select 0 + i 26 track 00 o
12 drive select 1 + i 28 write protect o
14 motor on 2/ * i 30 read data o
drive select 2 32 side select i
16 motor on 0 i 34 ready * o

PIN 1-33 are all connected to ground (gnd).

*: Not used by the ST. +: Only one of these should be used. It
might be jumper-configurable which is the active input.

C) Supply the drive with some power. I'm not sure if an 1040's
internal supply can cope with two drives. However, since
3.5 inch drives have a low powerconsumption (my 1036A is
rated at 1.8 W), a simple 5/12 volts powersupply shouldn't
be so costly. The connections looks like this



D) Add cabinet to your taste.

There's a tiny fly in the ointment, however. (There had to be, right?)
The VBL-interrupt routine in the ST, uses the status of the
WRITEPROTECT-line from the drive to check if the disc has been
ejected. Since the level of this signal is reflected in the

statusregister of the floppydisc-controller, all the VBL-routine has
to do is read the contents of this register from time to time. For
this system to function, the drive has to toggle its WRPROT-line in
some fashion (which i haven't bothered to figure out), whenever the
disc is ejected. This represented no problem in my case, since the
latest version (which was the one I used) of NEC FD1036A, is fully
"ST-modified" and thus plug-in-and-go compatible. I bought my drive in
W-Germany and payed around 220,- DM, which is VERY cheap by danish
standards. (#include<standardcomplaint.tax> :-( ).

Well, I have to stop rambling. Let's hear more about homebrewed
hardware-projects on this group. See you next time on the Newsshow.

agreeded, I alway felt the advantages of the BMS solution were:

1. It came with a battery backed-up real time clock

2. It supports two hard disks on the same controller

3. If and when i wanted to upgrade to a larger disk, i just unplugged
the old one and plugged the new one in

as to cost, be creative, most cities support at least one good used
electronic surplus/salvage store

>different drive in their 1040 or repaired the original one?
>If so please advise me.
>(Note: Our machines will be down(ish) from 24th Dec to Jan 5th)

I have replaced the 1040 drives with the newer mech's that are
currently shipped as external drives. Have had no problem with doing this
at all.

If I were you, I would clean the head with Freon TF, and get all the
dust that usually seems to collect inside the drive. This is the main problem
that I have seen in the internal drives, other than the eairly drives having
the write protect to go out, in which case I replaced it with a small micro
toggle switch.

I have seen drives that were running slow, and still read the data
onthe disk fine, but didn't write for ^%$#*(. Also have seen some drives
that didn't write well either and the cause was due to a mechanical problem
with a lever mounted for upper head pressure. Problem was due to this lever
being a little loose and thus making alot of noise (like ball bearings inside)
and just getting this a little tighter lessened the vibrations allowing the
drive to again work well.

One other thing that I noticed was that some drives, lost the
ability to turn the disk at proper speed *if the drive was sitting in the
correct position. When I went and turned the drive over (upside down) to
further look at the problem, the problem was gone! Turn the drive back over
and the problem returned, turn it upside down, and the drive worked fine

again. Weird problem. Unfortunatly, the direct drive motor for turning the media is not available from Atari, so a new drive was installed. One of the newer external ones. Problem solved....

From: percival!actor@uunet.UU.NET (Clif Swinford)
Subject: Re: general info on disk drives wanted

From my experience, the Astra is a loser. I work in a store where we sell Atari, Supra, and Astra hard drives; that's my order of preference, too. The Astra (at least in our store) sells for the same price as an Atari hard disk and a separate Atari SF314 drive. We've had nothing but trouble with the Astra's floppy, so much so that we've taken to leaving the floppy on our floor model unconnected so as to keep it from destroying disks. The hard disk is a good one, but so are the others, and you can get an Atari or Supra 20 meg drive plus an Indus floppy for less money, and if one dies you don't have to take both into the shop.

From !seismo!uunet!portal!atari!apratt Thu Dec 31 12:32:29 EST 1987

in article <8712211937.AA01474@ucbvax.Berkeley.EDU>,
gjwelych@SUNRISE.ACS.SYR.EDU ("Welych, Gregory J.") says:
> What in the Atari drives senses the change of media?
> And how does the drive signal this to the ST?

The media-change sensing is done using the write-protect signal from the drive. The assumption is that when you take a write-enabled disk out of the drive, the write-protect sensor will pop up, and the drive will signal "write protect" to the controller. When you put another disk (or even the same disk) in the drive, the write-protect sensor will be pushed down again and signal "not write protect."

When a disk is really write protected, of course, there will be no transition on the line. Because of this, write-protected disks go into the "maybe changed" state 1 sec (I think) after the last disk

access. (The assumption is that you won't change from one write
protected disk to another within one second).

When a disk is in the "maybe changed" state, the next access (through
RWABS or maybe Floprd) will check the serial number of the disk in the
drive. If it hasn't changed, then the disk hasn't changed, either.
This is another assupmtion: you should not have two disks with the same
serial number.

If your drive suppresses write protect changes when there is no disk
present, then switching from one write-enabled disk to another will not
cause the transition, and the BIOS will not sense media change.

Sorry. Nobody said it would be easy.

>
>Until a recent (fairly) Atari Fest in the area, I was under the impression
>that the BMS kit was the only one out there. At this fair, I was introduced
>to ICD, Inc.

I, too, am a VERY SATISFIED customer of BMS. My opinions of the ICD offering
differ somewhat from yours, however.

I saw ICD's product at the Worcester AtariFest, and while I think they have
an acceptable product, I believe that their methods are less than acceptable.
My local Atari dealer (exclusively Atari for the last 4+ years) tells me that
ICD has been present in the 8-bit marketplace for a considerable time.

My contact at BMS, however, told me that ICD initially contacted BMS with a
great deal of interest in the BMS board, and assured BMS that ICD was not
going to get into that business. A short while later, ICD released a board
which has a strong resemblance to the BMS board with a few modifications.

Note that I am NOT advocating sole-sourcing of add-ons for the ST line -- I
just do NOT like the idea of an "established" company staying out of the ST
marketplace until (or unless) they can piggyback off of the efforts of a
fledgling operation by misrepresenting their intentions.

As to your first reservation (above), BMS follows the Atari standard of only allowing 4 partitions per drive, while Supra established an "extended format" which permits 8 partitions per drive, but is NOT compatible with Atari's AHDI. ICD follows the Supra extended format. I think if you go back to Tom Love's excellent article in a back issue of Current Notes you will find that BMS did not have a disk driver of their own, and that users would just use Atari's formatter (format.prg?) and driver (ahdi.prg).

From rochester!rocksanne!xrxns!xerox12!toml Thu Dec 31 12:32:51 EST 1987

re: bugs in bms package -

i've been running a bms-based hard disk system since last january.
the only bugs i have ever encountered were software bugs. recall that
the bms adapter board has a battery-backed clock. it seems that chris
rhodin, the guy who runs bms and does the development, made a very small
but important error in the clock-setting program (settime.prg, i think -
the one that goes in your auto folder) which screwed up on february.
actually it was kind of humorous. never affected hard disk use at all.
he found the problem feb. 1 1987, and had updated software out in the mail
to everyone shortly thereafter.

i'm mainly posting this to stop what could be a harmful rumor. i am a
very satisfied customer of berkeley microsystems. their product is
reasonably priced, in my opinion, and their telephone support is superb
(of course, before they had any documentation, it had to be! :-)

the bms-100 adapter has evolved somewhat; it is supposedly laid out more
attractively on the board, it is pretty well documented, the software has
all been rewritten. it's a pretty mature product now.

if there were hardware bugs, i would be interested in hearing about them.
if not, please don't do bms any disservice by spreading such rumors.

one more note: i wrote an article for ST Applications magazine last spring
detailing the construction of a bms-based hard disk system for the ST.
it covers all the details of a single-HD system, and vaguely addresses
the double-HD system too (at that time i only had one HD). it appeared
in march 87, i think. at that time i offered to mail out copies, in
either electronic or paper form, to anyone who requested one. that
offer still stands. note that the electronic form omits the graphics
(done on my cad system at work, not on the st), so if you want the whole
thing you should buy the magazine or request the paper copy from me.
if you want electronic, mail me at the address below; if you want paper,
send me a self-addressed stamped envelope to the postal address below.

From !mnetor!utzoo!yunexus!gen1!chris Thu Dec 31 12:39:26 EST 1987

I have noticed a few requests on the net for information regarding
hard drives, hard drive kits, and the like for the ST. I have just
purchased a "TAMI-HD40" hard drive system from FutureDOS, and am *very*
happy with it so far.

I own an Atari Mega-2 ST and required a larger disk capacity in order
to run GEM, Magic Sac, and OS-9/68000 efficiently. The single drive system I
received from FutureDOS is in a long enclosure that is designed to accommodate
a second half height drive.
Since the system is custom made, I ordered the 44 Mb (formatted) hard
disk configuration, for which I paid $1400 Cdn.. Other capacities are
available upon request. Also, all of the hard drive systems are fully
assembled and tested, so reliability is assured.

If you are looking for a high quality/high capacity hard drive system
at a reasonable price, then this may be the thing for you. You can
reach the folks at FutureDOS by writing them at

FutureDOS,
1207-120 Torresdale Ave.,
North York, Ontario,
CANADA, M2R 3N7.
Tel. (416) 736-0321

Christopher Parkinson
yunexus!gen1!yuplanet!chris

BTW-Standard disclaimer...I am in no way affiliated with FutureDOS, I am
just another happy customer!!!

That is definitely NOT true. The SH204 and SH205 do indeed return with
an error flagged when one occurs.

RE: ARC format

If you are just looking for a ready program to unARC file at VAX, you
can get a copy at CompuServe's VAX SIG which was written in FORTRAN.
I used to have a copy but didn't take it with me when changing job as the
new company doesn't have a VAX.

The source code of ARC can be found at IBM land. Some BBS (perhaps CompuServe
) have it posted. Also DEC user group may have an authentic version of ARC
in C (I crossed over some old messages at CIS a few months ago).

IEEE Computer's June 1984 issue has an article about the major compression
scheme ARC used, check page 8-19.

>need it/can't understand it, don't for a second presuppose others
>dont want/need/understand multitasking.

He said that he didn't see any arguments why multitasking is a REQUIREMENT
for a microcomputer. Thinking it's useful, and liking it don't cut it.

>Open mouth, insert foot. Open hand, take egg. Apply to face.

Do you do that often? Perhaps you should seek therapy.

>P.S. This is not a flame. This is not even a spark. If you would
>like flames, I'll be glad to lay into you, you little jerk.
It sure sounds like a flame to me. I'm not going to claim what I'm doing
isn't. Why don't you crawl back under the rock from whence you came?

Why can't people just forget this stupid argument? I bought my Atari
because it does what I wanted at the time, you bought your Amiga for the
same reason. Why can't you just leave it at that? When I bought my ST,
the Amiga was at least $600-$700 more expensive than the ST. I didn't have
that extra money. If I had, maybe I would have bought an Amiga. Maybe not.

I don't need this damned "my computer is better than yours because mine does
x, nyah nyah nyah" bullshit.

Dave,

I totally agree with your statement:

"BUT I still insist that, for the non "power user" there's no need for it."

The problem is that most computer users these days, are power users. The children running games don't need "high power or multitasking" - nor do people who really don't understand what a computer can do for them. Once someone reaches the point where they really understand what a computer can do, they should be given access to all the power they need or want to complete the required task - multitasking is just another tool they might need to complete that task.

The truth of the matter (bickering aside) is that there are useful things a true computer user or programmer can accomplish with multitasking that can make his/her life easier. (btw: I don't own a multitasking machine - but I do have a Sun 3/50 on my desk at work - and love it!).

All these flames about what machine is "better" are total trash. Every machine, ever created, is good for "SOME" task - not every task. The truth is that some tasks can be more easily done and/or done more efficiently with multitasking.

If you really want an example OK: Say you are running a mail server on your machine - you would still want to be able to do anything you normally do (editing, debugging, etc) while the mail server is running... For that, you NEED multitasking.

To make small computers able to do complex tasks - multitasking is required. Multitasking is just another tool -- like more memory, RAM disks, disk storage space, tape backup devices, sidecars, magic sacs, etc., etc. To most computer professionals, multitasking is just another tool you use to complete a task - it is a fact of computing life.

The major difference between carouselling (I love that term) and true multitasking is efficiency. You alluded to these above however the conditions where this is a win are greater than just the compile/edit cycle mentioned. Basically you keep the CPU busy and get more work done.

The other advantage to true multitasking is the transparency of it. When you program this becomes self evident. No special steps are needed to run two tasks simultaneously, and flexibility is enhanced. A really nice example is Carolyn's Pallete Tool. This runs as a separate task and can be run with any other program to provide a color adjuster. Plus you don't have to go through hoops/special startup sequences etc like you do with DAs. It doesn't make it better, it demonstrably makes it more efficient over the long term.

Anyway, it is a hell of a lot easier to not use than it is to simulate when it isn't built in. My whole case on 'picking a computer' is based on what it *can* do versus what it was *designed* to do.

Simply put, rating two computers can be done rationally.

If any program that can be written on computer A, can be identically duplicated on computer B. And, a program can be written on computer B that *cannot* be identically duplicated on computer A. Then, computer B can be said to be *more capable* than computer A.

If any program that can be written on computer A, can be identically duplicated on computer B. And, the program on computer B is consistently faster than computer A. Then, computer B can be said to be *more powerful* than computer A.

If any program can be written for computer A, that computer B cannot duplicate, and any program can be written for computer B that computer A cannot duplicate. Then these two computers can only be compared while specifying the limits of the comparison.

Once again, I would like to see a comp.sys.compare newsgroup.

From: "Welych, Gregory J." <gjwelych@sunrise.acs.syr.edu>
Subject: Even more thoughts about multi-tasking.....
To: "info-atari16" <info-atari16@score.stanford.edu>
Reply-To: "Welych, Gregory J." <gjwelych@sunrise.acs.syr.edu>

I just sat here reading my Info-Atari16 mail and read about 20 replies,
and counter-replies. All on the subject of multi-tasking.

I think that the issue is NOT joe-average-user being too dumb to use
a multi-tasking environment, but that they don't have a NEED to as of yet.
To whom ever said that Joe-Average-user is NEVER going to need multi-tasking,
have you ever look at the future prospects??? Maybe they don't need or
want to use it now (or even know HOW to), in the future, it may be
NEEDED by ANY user of a computer. I think the MAIN reason multi-tasking
personal computers are not extremely popular, is due to the LACK of
them on the market. Yes, I know there are some on the market now, but
five years ago, name one! (note I said personal computer and not mini's or
super micros) This lack of public use (and abuse) of multi-tasking is
why joe-average-user doesn't feel a NEED for it.

As a side note, only the recent emergence of high-resolution graphic
displays have made using a multi-tasking operating system easy enough
for non-hacker types. Currently, I rarely use the multi-tasking abilities
of the VAX I'm using now. The reason is NOT that I have no need or ability
to use it, but that it is VERY difficult to use easily. And due to the lack
of EASE-OF-USE, I haven't tried to use it to it's fullest extent where
I currently sit saying, "It sure would be nice to be doing such-and-such
while I'm doing so-and-so!". If the VAX had a nice, inexpensive, easily
gotten, and logical graphic interface, I know I would be using the
multi-tasking to the hilt!

I see a day when EVERY computer had better have a multi-tasking operating
system. The express need will stem from the, as of yet, unexplored uses
of computers in normal human existence.

I doubt many people feel the way I do, but at least to me, these are the
reasons I will NEVER get another computer with-out a multi-tasking,
graphic environment.

Please note: The above is NOT a flame to anyone, about anything, or even
just for the fun of it. It is just the expression of my
thoughts on the subject.

Just a thought,
Greg Welych.

PS: Please, people, let's not start ANOTHER "My computer is better than yours"
war. I have had enough of them.

Date: Wed, 23 Dec 87 22:51 AST
From: <FXDDR%ALASKA.BITNET@forsythe.stanford.edu>
Subject: Multitasking and Big Brother
To: info-atari16@score.stanford.edu
X-Original-To: info-atari16@score.stanford.edu, FXDDR

Another aspect in the debate over multitasking comes to mind. A few weeks
ago some guy was hawking his book on a talk show...don't recall the author
or the title but it was pretty much the antithesis of the "Micro Millenium"
that came out a few years back.
His theme on the show was that office automation most often _reduces_ the
office productivity (I've seen this phenomenon mentioned in Infoworld and
elsewhere so I'll assume there's some truth to it). So managers will be
forced to either toss a lot of the techno-glitz and hope productivity
improves, OR employ `watchdog' software to see that everybody is meeting
quotas and not goofing off...he called that the `electronic sweatshop'
approach. The argument went like this:
Right now, PCs are still pretty slow. There is time for employees to
get away from the machine for a few minutes while it calculates, sorts,
or whatever. But the new generation of PCs can do several things at
once, so instead of a moment's relaxation the employee will just move
on to a new task. And employers will have the ability to see that they
do just that.

I've heard that such monitoring is being used a little already for cashiers
and ticket agents.

Personally, when I first used multitasking systems I thought it was great,
and did a lot of simultaneous compiles and whatnot. But these days I
rarely try it...seems there's always paperwork to do and journals to read
while the computer is busy, so I mentally multitask. Getting the eyes
off the screen (*&?!! VT-compatibles) reduces headaches too. After stopping
to think about it, I don't know that I'd walk across the street to pick up
a multitasking os. Kinda like quadraphonic sound...cute concept but I wouldn't
pay extra for it.
Having used up a week's worth of computer blasphemy in this message, I'll quit.
Notes:
1) No, I didn't post to Amiga. I've lost what interest I had in that machine.
2) If you've sent me mail in the last month (or two?), I haven't been keeping
up with it. I'm clearing up the backlog and hope to be caught up shortly...
sorry.

Subject: Re: Nothing about: Re: Multi-tasking? A nightmare...
To: info-atari16@score.stanford.edu

Please, could we turn down the flames a bit.

On the systems that don't have multi-tasking, such as the IBM PC and the Mac, we observe people desperately fighting the operating system to get some concurrent operations going. Terminate-and-stay-resident programs, such as Sidekick on IBM PCs, were an attempt to get around the lack of multi-tasking. The attempt was only moderately successful, and such programs often interfere with each other and the program they preempt. Microsoft takes the position that such programs violate the rules of MS-DOS and has warned for years that they will not work under future versions of MS-DOS. They won't work under OS/2, but OS/2 offers multi-tasking, so they will not be needed.

PC spooling programs, which must patch into interrupt locations and store into the operating system, have similar problems. (Try to get a printer spooler and a plotter spooler both running at the same time.) Even desk accessories on the Mac, which are officially supported by the operating system, are something of a kludge internally.

So what we see, on the systems that don't offer multitasking, are attempts to achieve it through hacks that don't work too well.

The ST's BIOS is re-entrant. GEMDOS is not. (I have a multiuser BBS system to prove it...) You just have to make sure that each task has its own BIOS register save area. That took me a while to figure out -- basically you switch the BIOS stack pointer in your task-switching routine, as well as the user stack pointer and all the registers. Multitasking on the ST is actually fairly trivial, as long as you don't try to use Pexec() or Pterm(). I'm working on rewriting both of those right now for the background Xmodem accessory in ST-Talk Professional.

I doubt many people feel the way I do, but at least to me, these are the reasons I will NEVER get another computer with-out a multi-tasking, graphic environment.

Please note: The above is NOT a flame to anyone, about anything, or even just for the fun of it. It is just the expression of my

thoughts on the subject.

Just a thought,
Greg Welych.

PS: Please, people, let's not start ANOTHER "My computer is better than yours"
war. I have had enough of them.

Another aspect in the debate over multitasking comes to mind. A few weeks
ago some guy was hawking his book on a talk show...don't recall the author
or the title but it was pretty much the antithesis of the "Micro Millenium"
that came out a few years back.
His theme on the show was that office automation most often _reduces_ the
office productivity (I've seen this phenomenon mentioned in Infoworld and
elsewhere so I'll assume there's some truth to it). So managers will be
forced to either toss a lot of the techno-glitz and hope productivity
improves, OR employ `watchdog' software to see that everybody is meeting
quotas and not goofing off...he called that the `electronic sweatshop'
approach. The argument went like this:
Right now, PCs are still pretty slow. There is time for employees to
get away from the machine for a few minutes while it calculates, sorts,
or whatever. But the new generation of PCs can do several things at
once, so instead of a moment's relaxation the employee will just move
on to a new task. And employers will have the ability to see that they
do just that.

I've heard that such monitoring is being used a little already for cashiers
and ticket agents.

Personally, when I first used multitasking systems I thought it was great,
and did a lot of simultaneous compiles and whatnot. But these days I
rarely try it...seems there's always paperwork to do and journals to read
while the computer is busy, so I mentally multitask. Getting the eyes
off the screen (*&?!! VT-compatibles) reduces headaches too. After stopping
to think about it, I don't know that I'd walk across the street to pick up
a multitasking os. Kinda like quadraphonic sound...cute concept but I wouldn't
pay extra for it.
Having used up a week's worth of computer blasphemy in this message, I'll quit.
Notes:
1) No, I didn't post to Amiga. I've lost what interest I had in that machine.
2) If you've sent me mail in the last month (or two?), I haven't been keeping
up with it. I'm clearing up the backlog and hope to be caught up shortly...
sorry.

Subject: Re: Nothing about: Re: Multi-tasking? A nightmare...
To: info-atari16@score.stanford.edu

Please, could we turn down the flames a bit.

On the systems that don't have multi-tasking, such as the IBM PC and the Mac, we observe people desperately fighting the operating system to get some concurrent operations going. Terminate-and-stay-resident programs, such as Sidekick on IBM PCs, were an attempt to get around the lack of multi-tasking. The attempt was only moderately successful, and such programs often interfere with each other and the program they preempt. Microsoft takes the position that such programs violate the rules of MS-DOS and has warned for years that they will not work under future versions of MS-DOS. They won't work under OS/2, but OS/2 offers multi-tasking, so they will not be needed.

PC spooling programs, which must patch into interrupt locations and store into the operating system, have similar problems. (Try to get a printer spooler and a plotter spooler both running at the same time.) Even desk accessories on the Mac, which are officially supported by the operating system, are something of a kludge internally.

So what we see, on the systems that don't offer multitasking, are attempts to achieve it through hacks that don't work too well.

The ST's BIOS is re-entrant. GEMDOS is not. (I have a multiuser BBS system to prove it...) You just have to make sure that each task has its own BIOS register save area. That took me a while to figure out -- basically you switch the BIOS stack pointer in your task-switching routine, as well as the user stack pointer and all the registers. Multitasking on the ST is actually fairly trivial, as long as you don't try to use Pexec() or Pterm(). I'm working on rewriting both of those right now for the background Xmodem accessory in ST-Talk Professional.

Here's a real-world example. Note that this is from the
programmer's perspective, not the user's. As you will see later, this is
irrelevant.

The specifications are as follows: You are to design a space
invaders-type game. There is one spaceship at the top of the screen, and a
gun at the bottom. The spaceship moves across the top of the screen from
left to right; as it does so, it "drops" letters forming words down the
screen.

As the user types on the keyboard, the program checks to see if the
letter typed matches the one the gun is currently under. If so, the letter
is shot and the gun moves one position to the right (to the next letter in
the word. If they don't match, a short error signal is delivered to the
user.

The screen will look like this:

```
--------------------------------------------------------------------------------

...<-=O=->

S P A C E W E L L C R A

T H A N T H I S H A L L K I L L T H R I L L L A K E G R E A T

A N P A R T D R A T S P A C E B E A T H E A R S E A D R E A

A T H E R M A P T H A N F O R H E A R T

|
A
/#\
--------------------------------------------------------------------------------
```

The spaceship moves across the top of the screen at a fixed rate.
When it reaches the end of the row, all the rows drop down one, and the
ship returns to the left side.

To make it more interesting, a range of colors in the spaceship are
to be cycled, to make it look like it's spinning. The cycle rate is totally
independent of any other regular rate in the program.

Don't worry about winning or losing at this point; they'll
complicate the issue.

Now. Design this program, first on a system with multitasking,
and then on a system without it. Discuss the design issues that need to be
considered, and how you would address them under each environment. "Be
specific; give examples."

Whether or not the machine multitasks should be made invisible to
the user; both versions should run the same as far as the user is
concerened.

I designed this very program on the Amiga. I was porting the
program from the Atari ST, working from the ST source code. Before posting
my approach and ultimate solution to the problem, I want to see how others
would address it.

That is, if anyone cares.....

[In the article titled "Re: Multi-tasking? A nightmare...", Dec 22, 1987,

> How many years have you owned a personal computer Joseph?

I don't know about Joseph, but I've been stumbling along for about
eleven years now.

> Were you ever actually around when punch cards were being used?
Yup. IBM 1130. Didn't like it, either.
> Were you around when all you could do with a personal computer was toggle
> switches on the front panel and bring an AM radio close to the CPU to
> produce "music"?
Yup. I've even used a ASR-33 TTY. Wow.
> Did you ever put together one of those personal computers (you know,
> before Radio Shack started mass production of the TRS-80 model I)?
No, unfortunately. I lusted after a SOL-20 myself. But then the
Commodore PET came out (predates the TRaSh-80, BTW), and I wanted one of
those. My first ended up being a C-64.

I'm still trying to discover what all this arguing accomplishes...
It's fun, though.....

>_____________________/____

First off I must agree that the ST is a pretty solid machine as
stated above. I have been doing the repairs (Out of Warranty) for quite
a while in the Milwaukee Area here now, The main problem that I have been
seeing is in the newer drive mech's. The machines are pretty solid even
when they go through alot of transfer.

I myself have one of the first machines that came out, in 1985,
a revision A board. I have not had the problems with the chips unseating as
many other's have had.

Now being of the technical nature that I am, by vocation also, I
decided to make a fix for the machines and have passed it along via our
local user group (Mil*Atari Ltd.). It's really quite simple, and has
made the fix pretty perminent.

What I did was to remove the MMU (Really a MCU) very carefully, and
place the chip on a piece of tin foil while out of socket. Now what I did was
to take a tool that I fashioned from a dental tool. Mainly it was just the
filed down end.

With the chip out, I carefully pryed up all 40 contacts on the chip
socket, (just a bit for better contact) then took a eraser pencil and
cleaned all the contacts making sure that the pins didn't get pressed down
again.

Now I took a small piece of double sided foam tape (The thin stuff)
and placed that in the center of the socket.

Now I remount the chip, and reassemble the machine. I have yet to have
a machine come back for any reason concerning the MMU, outside of it going
bad due to the older power supplies regulator to not regulate too well, and
causing damage to the MMU and possibly other chips.

Of course you could go about the same routine, except in place of
the double sided foam tape, get your local Atari service center to sell you
two of the clips that are used on the newer machines, to make sure that the
chip stays seated.

The above can be done also to the GLUE chip. Same size and type.

From: mcvax!jack@uunet.uu.net (Jack Jansen)
Subject: the real advantage of multi-tasking.
To: info-atari16@score.stanford.edu

Lots of people say things like 'I don't need real multi-tasking,
I'm happy with a spooler and one or two other utilities'.

The point, however, is that applications like spoolers become
completely trivial once you have multi-tasking. 90% of the code
(and the most error-prone 90%, at that) is spent stealing vectors,
jumping in and out of supervisory mode, making sure your program
isn't overwritten by something else, etc etc etc.

I've been working on a network where a number of atari's can use
each others disks, but things got so incredibly hairy that I've
suspended the project and started thinking about making the BIOS
(or maybe even GEMDOS) multiprogrammed first. This will make my
remote-disk almost as trivial as a ramdisk.....

From: mcvax!ukc!its63b!hwcs!neil@uunet.uu.net (Neil Forsyth)
Subject: Failing Disk Drive & Strange TPA pointer
To: info-atari16@score.stanford.edu

Boo hoo the disk drive on my 1040ST is not working. I know it is the drive because I have swapped it in other machines and the problem moved with the drive. The symptoms are strange in that it reads every track on a disk fine but has trouble writing. I say trouble because sometime it formats a track ok sometimes not, but never a whole disk. I had a look at a track it had tried to format and found corruption (gap bytes inconsistant & data damaged ie $E5 corrupted.) If I can't fix this drive I will have to buy a replacement and that will kill my slim chance of being able to afford a hard drive.
I phoned a company that upgrades the internal SS drive in a 520STFM to DS and asked if the same drive could be fitted inside a 1040. They said no, which I think is pretty strange since I thought (as most do) that the 520STFM was just a 1040 with a lesser drive and some RAM missing. Has anyone else put a different drive in their 1040 or repaired the original one?
If so please advise me.
(Note: Our machines will be down(ish) from 24th Dec to Jan 5th)

Another interesting point:
I wrote a little C program print out a programs base page address and the operating systems start of TPA pointer (at $432). When run it printed out a high base page address eg. $23??? and $A100 for the start of the TPA which is to be expected. But when I put the program by itself in the AUTO folder on a floppy and booted up the machine with a power down/up it came up with $A204 and $A100 respectively. Can anyone tell me why the OS takes this memory away?
I know I have a megabyte to play around with but I like to ponder/solve such mysteries.

Thanks in advance and a Merry Christmas to all who know me or would like to.

Subject: drive problems

PROBLEMS WITH MY DISKDRIVE

Lately I have been experiencing some problems with
my diskdrive on my ST (1040). When the machine has been running some
time and I write something to my disk (or read something from it)
it will keep on spinning (red light also remains on). It seems to be
due to the heating of some part, since it does not happen when the machine
is cold (boots). A warm boot exstinguishes the light for a moment,
bit does not solve the problem.
Has anyone had similar experiences with his ATARI, and if so what
was the solution?
Any comments are appreciated.

Oh, I don't know about that. Our Amiga club did a survey of its
users, who would probably fit into most people's idea of "normal" users, and
over 80% of them had modems. Granted, most of them used the modem for bbsing,
but that is certainly an environment in which one could use multi-process
capability, be it true multitasking or simply context switching. Amazingly
enough, the RS Color Computer Club I formerly belonged to had a much-much
lower percentage of modem users (on the order of around 20% if I remember
correctly). Perhaps it is too much of a hassel to do a days work one step
at a time?
I wouldn't consider myself a "normal" user either, but something I have
found quite handy is the ability to have a directory showing up on one page
while trying to reorganize it on another.

From: portal!atari!apratt@uunet.uu.net (Allan Pratt)
Subject: Re: about ST disk drives (and media change)
To: info-atari16@score.stanford.edu

in article <8712211937.AA01474@ucbvax.Berkeley.EDU>,
gjwelych@SUNRISE.ACS.SYR.EDU ("Welych, Gregory J.") says:
> What in the Atari drives senses the change of media?
> And how does the drive signal this to the ST?

The media-change sensing is done using the write-protect signal from the
drive. The assumption is that when you take a write-enabled disk
out of the drive, the write-protect sensor will pop up, and the drive
will signal "write protect" to the controller. When you put another
disk (or even the same disk) in the drive, the write-protect sensor
will be pushed down again and signal "not write protect."

When a disk is really write protected, of course, there will be no
transition on the line. Because of this, write-protected disks go
into the "maybe changed" state 1 sec (I think) after the last disk
access. (The assumption is that you won't change from one write
protected disk to another within one second).

When a disk is in the "maybe changed" state, the next access (through
RWABS or maybe Floprd) will check the serial number of the disk in the
drive. If it hasn't changed, then the disk hasn't changed, either.
This is another assupmtion: you should not have two disks with the same
serial number.

If your drive suppresses write protect changes when there is no disk
present, then switching from one write-enabled disk to another will not

cause the transition, and the BIOS will not sense media change.

Sorry. Nobody said it would be easy.

From: mcvax!diku!iesd!lbn@uunet.uu.net (Lars Bo Nielsen)
Subject: Cheap Harddiscs
To: info-atari16@score.stanford.edu

Considering the relative high prices on ST-Harddiscs, and the forever
falling prices on PC compatible harddiscs, it seems natural to
attempt interfacing one of these to the ST.

We are aware that there might be a lot of problems. Not knowing the
PC-hardware in details, one of the problems one could foresee is the
existence of a DMA-controller on the PC-controller card. Since the
ST is allready fully equipped in this respect, the PC-DMA might get
in the way. Another problem is the fact that, when booting up, the
ST makes certain assumptions on the part of the (possibly) connected
harddisc. I.e it has to understand certain commands (bitpatterns).

We saw the solution offered in "ST World", in which two adapterboards
were used. One to convert the ST-interface to SCSI, and the other to
connect a bare industrystandard drive to the SCSI. The cost of these
two boards plus the bare drive, however, nearly equals the price
of an ordinary ST-drive (at least in this part of the world, don't
tell us about high taxes :-).

So, if anybody out there has any suggestions in this respect,
please let us know.

We will summarize any received mail, in a posting to the net.

Here's a real-world example. Note that this is from the
programmer's perspective, not the user's. As you will see later, this is
irrelevant.

The specifications are as follows: You are to design a space
invaders-type game. There is one spaceship at the top of the screen, and a
gun at the bottom. The spaceship moves across the top of the screen from
left to right; as it does so, it "drops" letters forming words down the
screen.

As the user types on the keyboard, the program checks to see if the
letter typed matches the one the gun is currently under. If so, the letter
is shot and the gun moves one position to the right (to the next letter in
the word. If they don't match, a short error signal is delivered to the
user.

The screen will look like this:

```
--------------------------------------------------------------------------------

...<-=O=->

S P A C E W E L L C R A

T H A N T H I S H A L L K I L L T H R I L L L A K E G R E A T

A N P A R T D R A T S P A C E B E A T H E A R S E A D R E A

A T H E R M A P T H A N F O R H E A R T

|
A
/#\
--------------------------------------------------------------------------------
```

The spaceship moves across the top of the screen at a fixed rate.
When it reaches the end of the row, all the rows drop down one, and the
ship returns to the left side.

To make it more interesting, a range of colors in the spaceship are
to be cycled, to make it look like it's spinning. The cycle rate is totally
independent of any other regular rate in the program.

Don't worry about winning or losing at this point; they'll
complicate the issue.

Now. Design this program, first on a system with multitasking,
and then on a system without it. Discuss the design issues that need to be
considered, and how you would address them under each environment. "Be

specific; give examples."

Whether or not the machine multitasks should be made invisible to
the user; both versions should run the same as far as the user is
concerened.

I designed this very program on the Amiga. I was porting the
program from the Atari ST, working from the ST source code. Before posting
my approach and ultimate solution to the problem, I want to see how others
would address it.

That is, if anyone cares.....

Hello Tom,

Very nice of you to offer to send copies of your BMS article
over the net. I would love to have a copy as I am considering going
this route to a hard drive for my 1040 ST.

ADDRESS: kemp@unsvax

Thanks in advance,

THESTARTTHESTARTTHESTARTTHESTARTTHESTARTTHESTARTTHESTARTTHESTARTTHESTART

This is partially a retransmission of an earlier posting, but since I'm
not sure that the first posting got around, and there's been some talk
on the subject since then, here goes again.

In message <236@xrns.UUCP> Tom Love writes:

>hello out there... i hope i am not adding to the clamor of people
>crying out for help with 5.25" drives; this is actually a different
```

>question. i would like to have an external 3.5" DSDD floppy drive
>to go along with the one already inside my 1040ST. i do not, however,
>desire one bad enough to pay the $200 plus which atari dealers seem to
>want to charge. i do not mind a little hardware hacking, and don't
>mind scabby looking assemblies with wires hanging out all over them.

In message <8712211937.AA0147@ucbvax.Berkeley.EDU> Gregory Welych writes:

>I have had one of my disk drives die on me, and rather than try to get
>it fixed, (it was only a single sided drive anyways) I decided to
>buy a cheap(er?) double sided drive. I hooked the new drive into
>the little converter card inside an Atari drive, and connected
>the power supply up. It works fine except for one slight problem

>Now to my main question:
> What in the Atari drives senses the change of media??????????!!????
> And how does the drive signal this to the ST?????
>
>Thanks in advance for any help,
>
>Greg Welych.

A couple of months back, my 1040ST suddenly blew its internal doublesided floppydrive. Since this was the only drive connected, it was a disaster ! My beloved Babs was (almost) dead. She would eventually boot, and come up with an empty desktop. That's a boring game (it wasn't so :-) at the time). What went wrong, I don't know, I tried plucking everything apart to check for any loose connections etc., but no luck. A custom chip in the drive did get awfully hot though.

To summarize, I found myself in a situation somewhat similar to yours: I had to get a new drive somehow. Not wanting to pay for an original Atari-drive, I came up with a reasonably cheap solution. A little research revealed that the internal drive used a standard Shugart interface (both in terms of signals AND connectors). So the problem could be reduced to finding a (cheap) bare drive equipped with the Shugart interface. That's easy enough. I picked a NEC-drive type 1036A, a drive known for its reliability and quiet operation. It's also smaller than the original Ataridrive (which seems be from Hitachi), so with a little fiddling I managed to get it crammed into

place. (I had to make some minor changes to the ST-case). The proof of the pudding ? Well, I removed the old drive, plugged in the new one, turned on the power, and Babs made a successfull boot from disc and has been happily humming ever since.

So to connect another external drive, all it seems one has to do is:

A) Buy a bare drive.

B) Pick up the floppysignals from the ST's external floppy interface. The connections are as shown (seen from the rear):

11 10 PIN SIGNAL INPUT/OUTPUT
1 read data i
9 8 2 side select o
13 12 3 gnd n.a
7 6 4 index i
14 5 drive 0 select + i
5 4 6 drive 1 select + i
7 gnd n.a
3 2 8 motor on o
1 9 direction o
10 step o
11 write data o
12 write gate o
13 track 00 i
14 write protect i

+ : On the 1040's external floppy interface, only the drive 0 select is active. It carries the actual drive 1 select signal. That way the external drive automatically becomes drive B.

The standard Shugart interface (again as seen from the rear) looks like this:

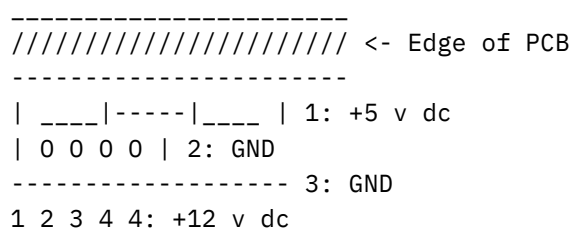
```
_____________________________________________________
////////////////////////////////////////////////////// <- Edge of
------------------------------------------------------ PCB
| 33 . . . . . . . . 1 |
| 34 . . . . . . . . 2 |
|----------------------|
```

PIN SIGNAL INPUT/OUTPUT PIN SIGNAL INPUT/OUTPUT
2 motor on 1 * i 18 direction i
4 in use * i 20 step i
6 drive select 3 * i 22 write data i
8 index o 24 write gate i
10 drive select 0 + i 26 track 00 o
12 drive select 1 + i 28 write protect o
14 motor on 2/ * i 30 read data o
drive select 2 32 side select i
16 motor on 0 i 34 ready * o

PIN 1-33 are all connected to ground (gnd).

*: Not used by the ST. +: Only one of these should be used. It
might be jumper-configurable which is the active input.

C) Supply the drive with some power. I'm not sure if an 1040's
internal supply can cope with two drives. However, since
3.5 inch drives have a low powerconsumption (my 1036A is
rated at 1.8 W), a simple 5/12 volts powersupply shouldn't
be so costly. The connections looks like this



D) Add cabinet to your taste.

There's a tiny fly in the ointment, however. (There had to be, right?)
The VBL-interrupt routine in the ST, uses the status of the
WRITEPROTECT-line from the drive to check if the disc has been
ejected. Since the level of this signal is reflected in the
statusregister of the floppydisc-controller, all the VBL-routine has
to do is read the contents of this register from time to time. For
this system to function, the drive has to toggle its WRPROT-line in
some fashion (which i haven't bothered to figure out), whenever the
disc is ejected. This represented no problem in my case, since the
latest version (which was the one I used) of NEC FD1036A, is fully
"ST-modified" and thus plug-in-and-go compatible. I bought my drive in
W-Germany and payed around 220,- DM, which is VERY cheap by danish
standards. (#include<standardcomplaint.tax> :-( ).

Well, I have to stop rambling. Let's hear more about homebrewed
hardware-projects on this group. See you next time on the Newsshow.

Uh... guys? Did you hear him say what I just heard him say?
Did Alan just say that there's ONLY ONE PERSON WORKING ON THE WORST PROBLEM
THEIR MACHINE HAS?
Just how small an operation is Atari, anyway?
(Actually, my guess is EVERYONE else is working on the 40-folder bug on the
Transputer box...)

When the fix is made, maybe I'll buy an Atari. I still have a certain
amount of faith in Atari's ability to deliver a decent value, despite all
the griping I've seen on this group since the ST came out.

>
> I *am* working on it, so don't despair. When the fix comes out, it will
> be more sweeping than you think (unless you think big).

Hmm. Does this suggest upcoming compatibility problems?
Or perhaps the advent of a new operating system altogether?
Could it be... MULTITASKING? Okay guys, warm up the rumor mills...

I have the new ("blitter") ROMs in my 1040, and have noticed the same behavior
when booting (I have a Supra disk, with their hard disk boot program
installed). Anyone have a guess as to why? (hello, apratt?)

> >I am also using GEMBOOT to overcome the 40 folder limit in TOS(has it been
> >fixed with the new ROMS?).

> I'm also interested on this question, and it has been already asked a couple

> on my hard disk and nothing happened. Does this mean that the problem is
> fixed? Or is it 40 folders DEEP?

Au contraire, the question has been answered here before in a definitive
manner. That answer is: NO The blitter ROMs do not fix the 40 folder bug.

The 40 folder bug refers to a problem where a filesystem on a hard disk or
diskette can become corrupted if more than 40 folders are accessed during
any one "session" with an ST ("session": period of use between re-boots).
A well-known workaround is the recently re-posted FOLDRXXX.PRG. Change XXX
in the program name to the number of folders you think you're likeky to
access during any one use of the machine, and stick the program in your
\AUTO folder, and re-boot.

I have heard from other netters that this bug is due to memory not being
freed-up when you jumo into and out of folders (directories). Correct
me if I'm wrong on that...

Just to add further confusion to this discussion...
I'm pretty sure that EIA RS-232c is just a hardware spec, eg., voltage
swing, line assignments, line loading, maximum line length, etc.
I don't believe there's anything in the spec about transmission protocols,
but I admit that the term RS-232 seems to have taken on a broader
colloquial meaning.

If those are the same ROMs that they are selling us developers, then the
answer is NO, the "40 folder bug" still exists, and the magazine article
is incorrect.

Neil: please jump in here if if the ROM upgrade for the 520/1040 is different
than what is in the Megas. I understand they are the same.

Subject: Re: Multi-tasking?
To: info-atari16@score.stanford.edu

Most PEOPLE don't multitask on a computer, they task-switch.

HOWEVER! Having multitasking available allows one to write (and use)
programs that multitask internally - sending messages back and forth
to each other, processing things concurrently rather than serially.
Many nice programs on multi-tasking machines just aren't possible on
any single-tasking machine because they INTERNALLY take advantage of
the machine's ability to multi-task and message-pass. Examples on
request, by E-mail.

As a user, MultiFinder is all I want, in most cases. But n

Unfortunately, even if you adhere completely to the standard, half the devices
in the world still won't talk to you without a breakout-box or cable
switching. When the only devices extant were computers and terminals, that was
no big deal, but tell me, how about hooking up a terminal concentrator/network
node to printers, computers, terminals, ... We're talking BIG-time troubles
here, we're talking about cabling nightmares to end all nightmares, even if
the standard IS followed (and it usually isn't -- e.g. a switcher which
arbitrarily decides to ignore an outgoing line if certain transitions don't
occure at certain times, and a network node which refuses to give the switcher
those transitions -- thus FUbaring things horribly.).

I hated having to mutilate my cable to flop RxD and TxD when I hooked up an
Amiga to a C-64 to transfer files at 9600 baud (yes, there's some magic
involved :-).

agreeded, I alway felt the advantages of the BMS solution were:

1. It came with a battery backed-up real time clock

2. It supports two hard disks on the same controller

3. If and when i wanted to upgrade to a larger disk, i just unplugged
the old one and plugged the new one in

as to cost, be creative, most cities support at least one good used
electronic surplus/salvage store

From: denbeste@bbn.com (Steven Den Beste)
Subject: A defense of Multi-tasking
To: info-atari16@score.stanford.edu

The original poster of this subject asked if there was a place where
multi-tasking was "essential". Many people responded with ways to use
multi-tasking, and the original poster always responded with one of two
answers:

1. There are other ways to do that that don't involve multi-tasking.
Multi-tasking therefore isn't essential for that task.
2. Only sophisticated users would want to do that. (He called them "Power
users.)

[Well, actually, there was a third answer used a couple of times:
3. Why are you being so abusive in a publicly posted article? Why didn't
you mail it to me so I could ignore it?
But that's not relevant to the subject...]

Let's get one thing straight. Multi-tasking is not "essential".

Neither are high-level languages. You can do anything in assembly language you
can do in C or BASIC, but it is less convenient. (MUCH less convenient.)

Nor are icons. People survived for years with text-only computer interfaces.

[For that matter, assemblers aren't "essential" either - you can key in machine
language directly in hex. And if you really want to get down to it, the
computer itself isn't "essential".]

I'm not suggesting that multi-tasking is as important as high level languages. That's not the point. I _am_ saying that requiring a feature to be "essential" to be included is a ridiculous criterion. The proper criteria are "useful" and "convenient".

On the Mac, there are many programs which can run simultaneously. To do this, however, they must be written in a very special way and the operating system must be specifically informed of each.

This is certainly an approach, and it seems to work for the Mac owners. There are certain special cases on the ST, I am sure, where more than one thing can happen at the same time (like a print spooler, for instance) - again it is done specially.

On a general purpose multi-tasker, ANY two programs can run simultaneously, unless one of them is being a particularly bad citizen. Though this isn't "essential", isn't that more convenient?

Which brings us to the second argument: Even if multi-tasking is indeed useful and convenient, it still won't be used by the great unwashed (called typical users in the original posting). Only "power users" would use it.

I don't quite understand why that means a feature should be omitted. Is it being suggested that a feature should only be included in a product if EVERY OWNER of that product will use it?

More importantly, it assumes that the users won't mature and become more sophisticated. Though a user may not use a feature when the product is first purchased, many times the user will grow into it as time progresses. "Power users" all began as unsophisticated users.

However, they won't mature if the machine they are on won't let them. I used to know quite a few owners of TRS Model I's, who were wizard Basic programmers, but were so restricted otherwise by the machine, that they might now never grow out of it, even if now given a better system.

In many ways, it is desirable that a machine provide some advanced features that the new user won't immediately use, so as to provide room for maturation and learning...

...providing it is done so that the user isn't forced to use this feature before ready.

Which leads me to the last point: The original poster stated, but never justified, a belief that providing multi-tasking was not merely useless but actually undesirable. I don't see it.

If:
1. Multi-tasking doesn't add to the purchase price of the product
2. It isn't intrusive on people who don't understand or need it right now
3. It is available for those who do understand it, or those who grow into it

Then
I state that it is an unmixed asset and should be in the product. I would

be very interested in hearing why, given these three assumptions, multi-tasking should be omitted from a product.

If you change any of the assumptions, then you are arguing against a strawman. All three of them are true for multi-tasking on the Amiga.

If you say "There are other ways" that is irrelevant. The point is not to show alternatives, but to actually demonstrate that multi-tasking is a negative thing in its own right.

If you cannot demonstrate that it is an actual danger, then it is merely useless for most (but not all!) users. But since, by the assumptions, it doesn't impede those users who don't use it, then its ability to attract "power users" makes it an asset. (It attracted me - it is the main reason I bought the Amiga.) (By the way, by so doing it represents an indirect asset for those unsophisticated users, because the "power users" are cranking out public domain software which the unsophisticated users can get for free. 120 880K Fish-disks at last count.)

We therefore have three classes of users for the multi-tasking machine:

1. Those who don't understand and won't use multi-tasking, but are not impeded by it. [If you think they are impeded, then we are out of the realm of the theory and into fact. I state as a fact that it does not impede rank amateurs on the Amiga.]

2. Those who don't understand it to begin with, but grow into it.

3. Those who understand it and use it from the very beginning.

Group 1 isn't bothered by its presence. Group 2 and Group 3 benefit by it. How can it be a bad thing?

Which brings us finally to the issue of the motive of the original poster. Let's try some syllogisms, shall we?

1. The Atari ST is an ideal computer
2. The Atari ST doesn't have multi-tasking
ERGO Ideal computers don't require multi-tasking.

1. If several machines offer multi-tasking, people will grow to expect it.
2. If people grow to expect it, they will refuse to buy machines not having it.
ERGO If several machines offer multi-tasking, the public will refuse to buy machines not having it.

1. If several machines offer multi-tasking, the public will refuse to buy machines not having multi-tasking.
2. The Atari ST doesn't have multi-tasking.
ERGO If several machines offer multi-tasking, Atari ST sales will suffer.

1. Anything which causes Atari ST sales to suffer is dangerous.
2. If several machines offer multi-tasking, Atari ST sales will suffer.

ERGO It is dangerous for other machines to offer multi-tasking.

Could these be the real reasons behind the original posting? Or maybe just a deliberate attempt to stir up trouble?

From: SARGON%UMass.BITNET@forsythe.stanford.edu
Subject: A different view on multitasking.
To: info-atari16@score.stanford.edu

In light of the humorous (if not entirely short sighted) notes on the usefulness of multitasking to the "average" microcomputer user I thought Id toss in some historically relevant views..

1. A microcomputer user will never need anything more than a few cassette tapes to hold his work.

2. A microcomputer user will never need anything but a TV set to display information from a computer.

3. A microcomputer user will never need even as much as 64K of memory.

4. A microcomputer user will never need a language other than interpretive BASIC to perform any task.

Last time I heard the Atari 1040ST came with an 800K floppy disk drive, requires a monitor (as Atari didnt put the modulator in there), comes stock with 1MB of RAM and doesnt come stock with BASIC. Does this make the designers at Atari morons for putting in such useless junk? I think not.

Finally, your "average" user of a modern microcomputer (this gets rid of the Apple II and C64 crowds) is more likely to be in a business or higher education setting than in the kitchen as a $x000 recipie file. Both of these areas are demanding the ability to share and distribute information. This means networks. Networks need software drivers that requires a certain degree of multitasking. Im sure Atari the self proclaimed "vertically integrated" computer maker will be (or hopefully IS) working on both multitasking and networking. The 286/386 and the 030 all have memory management hardware whether you use it or not. Why not use it?

Well, the bad way is to use Publishing Partner. It works unless
PP screws it up (which does happen). I have used this method (it is
how I got the graphics into our new UNIX products catalog) but would
like to have a cleaner way.

I agree with Mr. Storin's main point fully, and moreover think that Joe Average will, unless he's very careful, actually *learn* something about what his computer can do and take advantage of multitasking eventually, but--I think that a visit to a friend or neighbor with a CoCo 3 running OS-9 will show that one can have multitasking on an 8-bit machine. (Much less a visit to a place with a dozen folks hacking merrily away on a Gimix 6809-based computer.)

>
> -- Dave Meile

I normally avoid religious wars, but this is too much. Just who are these mythical "non-power-users" that don't need multi-tasking. Everyone is trying to convince you that they don't exist. I'll tell you what. You show joe user what muti-tasking can do and then tell him that he is too unsophisticated to use it. Then duck. Manufacturers who underestimate buyers go out of business. If "joe user" couldn't use multi-tasking, we would not have kludgo simulations (TSR's, desk accessories, etc.). As one of my co-workers posted, it is only a matter of education. Joe user expects magic from a computer. As soon as he realizes a computer can't do two things at once, like he can, he'll be unhappy. He wants multi-tasking.

And I'm not picking a bone for the Amiga over the Atari. Note my employer. We only support one of those two machines. And its not the Amiga.

Sorry, no cute signature file.

I can't count how many non-technical types I've shown Amy and they have
no problem comprehending what multitasking can do for them if they are
given a few examples. Once the light goes on they tend to use it often.
Heck, I don't even need to show then Amy - 4 or 5 well chosen sentences
does the trick. Which is why I am really dissapointed (to put it mildly)
that C= has not run commercials that help people to see the light. That
should be easy to accomplish in a 60 second spot, maybe even in 30 seconds.
Peter's commercial idea with Big Blue, Mac, Amy, and the flunky was a
classical case in point.

Subject: WordPerfect on ST
To: info-atari16@score.stanford.edu

Hey everyone! I'm looking for someone who has (or has used) WordPefect on
the Atari-ST. I'm thinking of buying this software!

I would be interested in the following:

1. How much faster (if any) is it than WordWriter-ST?

2. Is the spelling checker better than WordWriter-ST or Thunder?

3. Is the GEM interface good?

4. Are there Keyboard Equavilents to the Mouse/Gem commands?

5. Any other opinions or comments RE: Wordproccesing on the ATARI-ST

Thanks a bunch, and MERRY CHRISTMASS!!!!!!!!!!!!!!!!

From: portal!atari!neil@uunet.uu.net (Neil Harris)
Subject: Abaq Developer Kits
To: info-atari16@score.stanford.edu

Before my mailbox overflows:

There is a program in place for Abaq developers. In the USA, you can get information on what documentation will be available, and a more complete look at the Abaq itself, from Atari. In the UK you should go right to Perihelion.

To get the information package, write to:

Atari Corp.
1196 Borregas Ave.
Sunnyvale, CA 94086
Attn: Cindy Claveran

To become a registered developer of the Abaq, you can get the documentation package and get news of when developer units will be available. The cost is $100, sent to the same person listed above.

Subject: Info atari instructions.
To: info-atari16@score.stanford.edu

This message contains the latest info-atari instructions to subscribers. Please go through it (even seasoned users!) and retain for future reference. Of special interest to BITNET users (and interent users with access to bitnet) is a section on accessing the 16-bit program libraries at the Univ of Houston.

The info-atari moderators.

Welcome To Info-Atari.

1. Sending Messages

You may send messages to all "subscribers" by address-
ing it to

info-atari8@score.stanford.edu

and/or

info-atari16@score.stanford.edu

Administrative messages should be sent to

info-atari{8,16}-request.

Please do NOT send general messages to this address. Your
moderators get enough mail as it is!

2. Ground Rules

All messages should be in good taste. Commercial mes-
sages and advertisements are not permitted. When answering a
question, please consider carefully whether the answer
should go to the whole list, or just to the person who asked
the question.

The following ground rules should make the use of this
(or of any other) mailing list much easier:

* never send a message that a totally irrelevant to the
mailing list's purpose to a mailing list. This espe-
cially includes any expressions of irritation at
another list member.

* never forward a message that is totally irrelevant to
the mailing list's purpose to a mailing list.

* when replying to a message on a mailing list, reply
only to the sender of the message unless the reply is
of interest to the entire mailing list.

* avoid inserting the message being replied to in a
reply, especially in a message going to a mailing list.
The context of the reply should be clear from *your*
reply and from various mailer functionalities such as
Message-ID.

* when replying to an earlier reply that violates the
previous rule, ABSOLUTELY DO NOT make matters worse by
adding your own violation.

December 25, 1987

- 2 -

3. Archives

Archives are kept in several places in formats avail-
able to everyone. As described below, if you are on

ARPANET/DDN you will probably find it more convenient to retrieve files from the archive on radc-softvax.arpa using FTP. If you are not on ARPANET/DDN, or are unable to use FTP, you will be able to retrieve files from archives distributed over several Bitnet hosts by sending mail (notes) to a program called LISTSERV.

3.1. Archives on radc-softvax.arpa

Files from radc-softvax.arpa are available by FTP. FTP will work only for hosts directly connected to ARPANET/DDN. Please obtain local documentation and advice for the FTP user programming running on your host. There are two directories under the anonymous account. One for atari8 and one for atari16.

FTP to radc-softvax using login:guest and password:guest. To get the current list of available atari16 files do a 'get atari16/files.doc'. All of the atari16 files are stored in the atari16 subdirectory. If you need any other information, contact Marc Poulin.

The archive is maintained by Rodney Peck (Peck@radc-multics.arpa) and Marc Poulin (Poulin@radc-multics.arpa or Archives@radc-softvax.arpa).

3.2. LISTSERV

LISTSERV provides access to files for everyone who can send mail, independent of their location. Note, however, that intermediate notes have been known to refuse to handle long messages or have damaged them in transit. LISTSERV provides a number of features which you can access by sending mail (note) to LISTSERV. Only the barest minimum are described herein. On Bitnet messages should be sent to your nearest LISTSERV (the one from which you receive the info-atari digests). (If your address is not on Bitnet, an address for file servers is given below.) All mail sent to LISTSERV contains command lines. LISTSERV will respond by return mail. No subject is necessary in such mail. For more information send the command

INFO

3.2.1. List Names

The list_name for 16-bit Ataris is INFO-A16. The list_name for 8-bit Ataris is INFO-A8. These list names are used by Bitnet addressees for subscribing and unsubscribing

and by everyone for obtaining back copies of news digests. The list_names for programs stored in the archives are PROG-A16 and PROG-A8.

3.2.2. (Un)Subscribing

If you are on Bitnet you may add or remove yourself from the distribution list. It would greatly convenience the moderators if you would do so when you no longer wish to receive digests.

The command to join the list is

SUBSCRIBE list_name User_name

The command to remove yourself from the list is

UNSUBSCRIBE list_name

It would be most convenient if users took care of their own subscribing and unsubscribing, but messages to INFO-ATARI-REQUEST{8,16}@SCORE.STANFORD.EDU will still be accepted.

3.2.3. Accessing Program & Digest Archives

All digests are in the archives. There is a separate program library. You can obtain copies of files from LIST-SERV by sending a message in the specified format.

If you are on ARPAnet (or gatewayed to it), your mail concerning 16-bit Atari information should be addressed to

LISTSERV%CANADA01.BITNET@CUNYVM.CUNY.EDU

Mail concerning 8-bit Atari information should be addressed to

LISTSERV%TCSVM.BITNET@CUNYVM.CUNY.EDU

To obtain a list of files in the file server, the com-mand is

INDEX list_name

The command to obtain a specific file is

GET list_name file_name

for example,

GET INFO-A16 87-00076

December 25, 1987

If you want to learn more, send the message

HELP

The moderator of the 8-bit program library is John R. Dunning. This library is not yet available for use, and further information will be posted to both newsgroups as it becomes available.

3.2.4. LISTSERV Moderators

The person to contact if you are having problems (un)subscribing is Harry Williams (harry@marist.bitnet). The moderator of the 16-bit digest archives is Peter Jasper-Fayer (sofpjf@uoguelph.bitnet). The moderator of the 16-bit program archives is Richard Werezak (carson@mcmaster.bitnet). The moderator of the 8-bit archives is John Voigt (sysbjav@tcsvm.bitnet). The moderator of the 8-bit program archives is Arnold de Leon (adeleon@hmcvax.bitnet).

3.2.5. Information Concerning 16-bit Archive Organization

The digests are numbered sequentially as they come in. Sometimes the files arrive here out of order, or with missing ones, or with extra ones or with mail from BITNET users requesting information. Often the moderator has to logon to LISTSERV and re-name the files according to the "Subject:" line within it. Those "Subject:" lines are what end up in the indexes (in both "-A16" lists)

The program files are largely extracts from the digests (INFO-A16). As far as possible, they are numbered the same as the digests they came from. Other programs were inserted somewhere in the list. The numbers of these "inserted" files were selected so that they would appear in the index at about the correct CHRONOLOGICAL sequence. If no programs were included in the digests, and no contributions were received, then those spaces in the index numbers were left blank.

3.2.6. Supplemental information for BITNET users

Bitnet sites normally cannot make a connection to an internet site (such as Score) and FTP files over, so you do not have direct access to the archives on radc-softvax.arpa from your BITNET site. However, BITNET has some sites with all the good stuff, so you can get files from there. The LISTSERV's at CANADA01 and FINHUTC have old digests, and the ATARINET server at Univ of Houston has most of the best programs. You can get to the LISTSERVs by saying

TELL LISTSERV AT FINHUTC GET ATARI FILELIST

December 25, 1987

or

TELL LISTSERV AT CANADA01 GET ATARI FILELIST

to get a list of files. To get a specific file if you
know it's name, you can say

TELL LISTSERV AT <HOSTNAME> GET <FILENAME> <FILETYPE>

To get stuff from the Univ of Houston server, you can
say

TELL UH-INFO AT UHUPVM1 ATARINET HELP

or

TELL UH-INFO AT UHUPVM1 ATARINET INDEX

for further instructions. After you know a file's
name, you can get it by saying

TELL UH-INFO AT UHUPVM1 ATARINET SEND <FILENAME> <FILETYPE>

Contrary to all the comments from user's of Word Perfect in the
negative aspect, I can say that the version I got didn't have all the
bugs that I had seen mentioned. In fact Word Perfect Corp. is
one of the best software makers that I know of. If you OWN the
program, and have a problem with it, and they have a newer version
of it, they will send it to you, second day air sometimes.

This is one software maker that really backs their product!

>If so please advise me.
>(Note: Our machines will be down(ish) from 24th Dec to Jan 5th)

I have replaced the 1040 drives with the newer mech's that are
currently shipped as external drives. Have had no problem with doing this

at all.

If I were you, I would clean the head with Freon TF, and get all the
dust that usually seems to collect inside the drive. This is the main problem
that I have seen in the internal drives, other than the eairly drives having
the write protect to go out, in which case I replaced it with a small micro
toggle switch.

I have seen drives that were running slow, and still read the data
onthe disk fine, but didn't write for ^%$#*(. Also have seen some drives
that didn't write well either and the cause was due to a mechanical problem
with a lever mounted for upper head pressure. Problem was due to this lever
being a little loose and thus making alot of noise (like ball bearings inside)
and just getting this a little tighter lessened the vibrations allowing the
drive to again work well.

One other thing that I noticed was that some drives, lost the
ability to turn the disk at proper speed *if the drive was sitting in the
correct position. When I went and turned the drive over (upside down) to
further look at the problem, the problem was gone! Turn the drive back over
and the problem returned, turn it upside down, and the drive worked fine
again. Weird problem. Unfortunatly, the direct drive motor for turning the
media is not available from Atari, so a new drive was installed. One of the
newer external ones. Problem solved....

> Phil Hughes, SSC, Inc. P.O. Box 55549, Seattle, WA 98155 (206)FOR-UNIX
> uw-beaver!tikal!ssc!fyl or uunet!pilchuck!ssc!fyl or attmail!ssc!fyl

agreeded, I alway felt the advantages of the BMS solution were:

1. It came with a battery backed-up real time clock

2. It supports two hard disks on the same controller

3. If and when i wanted to upgrade to a larger disk, i just unplugged
the old one and plugged the new one in

as to cost, be creative, most cities support at least one good used
electronic surplus/salvage store

THESTARTTHESTARTTHESTARTTHESTARTTHESTARTTHESTARTTHESTARTTHESTARTTHESTART

This is partially a retransmission of an earlier posting, but since I'm
not sure that the first posting got around, and there's been some talk
on the subject since then, here goes again.

In message <236@xrns.UUCP> Tom Love writes:
```

>hello out there... i hope i am not adding to the clamor of people
>crying out for help with 5.25" drives; this is actually a different
>question. i would like to have an external 3.5" DSDD floppy drive
>to go along with the one already inside my 1040ST. i do not, however,
>desire one bad enough to pay the $200 plus which atari dealers seem to
>want to charge. i do not mind a little hardware hacking, and don't
>mind scabby looking assemblies with wires hanging out all over them.

In message <8712211937.AA0147@ucbvax.Berkeley.EDU> Gregory Welych writes:

>I have had one of my disk drives die on me, and rather than try to get
>it fixed, (it was only a single sided drive anyways) I decided to

>Now to my main question:
> What in the Atari drives senses the change of media??????????!!????
> And how does the drive signal this to the ST?????
>
>Thanks in advance for any help,
>
>Greg Welych.

A couple of months back, my 1040ST suddenly blew its internal
doublesided floppydrive. Since this was the only drive connected, it
was a disaster ! My beloved Babs was (almost) dead. She would
eventually boot, and come up with an empty desktop. That's a boring
game (it wasn't so :-) at the time). What went wrong, I don't know, I
tried plucking everything apart to check for any loose connections
etc., but no luck. A custom chip in the drive did get awfully hot
though.

To summarize, I found myself in a situation somewhat similar to yours:
I had to get a new drive somehow. Not wanting to pay for an original
Atari-drive, I came up with a reasonably cheap solution. A little
research revealed that the internal drive used a standard Shugart
interface (both in terms of signals AND connectors). So the problem
could be reduced to finding a (cheap) bare drive equipped with the
Shugart interface. That's easy enough. I picked a NEC-drive type
1036A, a drive known for its reliability and quiet operation. It's
also smaller than the original Ataridrive (which seems be from

Hitachi), so with a little fiddling I managed to get it crammed into
place. (I had to make some minor changes to the ST-case). The proof of
the pudding ? Well, I removed the old drive, plugged in the new one,
turned on the power, and Babs made a successfull boot from disc and
has been happily humming ever since.

So to connect another external drive, all it seems one has to do is:

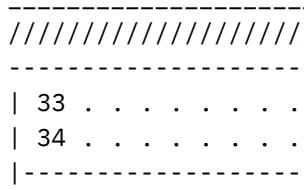
A) Buy a bare drive.

B) Pick up the floppysignals from the ST's external floppy
interface. The connections are as shown (seen from the rear):

11 10 PIN SIGNAL INPUT/OUTPUT
1 read data i
9 8 2 side select o
13 12 3 gnd n.a
7 6 4 index i
14 5 drive 0 select + i
5 4 6 drive 1 select + i
7 gnd n.a
3 2 8 motor on o
1 9 direction o
10 step o
11 write data o
12 write gate o
13 track 00 i
14 write protect i

+ : On the 1040's external floppy interface, only the drive 0 select is
active. It carries the actual drive 1 select signal. That way
the external drive automatically becomes drive B.

The standard Shugart interface (again as seen from the rear) looks
like this:



PIN SIGNAL INPUT/OUTPUT PIN SIGNAL INPUT/OUTPUT
2 motor on 1 * i 18 direction i
4 in use * i 20 step i
6 drive select 3 * i 22 write data i
8 index o 24 write gate i
10 drive select 0 + i 26 track 00 o
12 drive select 1 + i 28 write protect o
14 motor on 2/ * i 30 read data o
drive select 2 32 side select i
16 motor on 0 i 34 ready * o

PIN 1-33 are all connected to ground (gnd).

*: Not used by the ST. +: Only one of these should be used. It
might be jumper-configurable which is the active input.

C) Supply the drive with some power. I'm not sure if an 1040's
internal supply can cope with two drives. However, since
3.5 inch drives have a low powerconsumption (my 1036A is
rated at 1.8 W), a simple 5/12 volts powersupply shouldn't
be so costly. The connections looks like this

```
________________________
////////////////////// <- Edge of PCB
------------------------
| ____|-----|____ | 1: +5 v dc
| O O O O | 2: GND
------------------- 3: GND
1 2 3 4 4: +12 v dc
```

D) Add cabinet to your taste.

There's a tiny fly in the ointment, however. (There had to be, right?)
The VBL-interrupt routine in the ST, uses the status of the
WRITEPROTECT-line from the drive to check if the disc has been
ejected. Since the level of this signal is reflected in the
statusregister of the floppydisc-controller, all the VBL-routine has
to do is read the contents of this register from time to time. For
this system to function, the drive has to toggle its WRPROT-line in
some fashion (which i haven't bothered to figure out), whenever the
disc is ejected. This represented no problem in my case, since the
latest version (which was the one I used) of NEC FD1036A, is fully
"ST-modified" and thus plug-in-and-go compatible. I bought my drive in
W-Germany and payed around 220,- DM, which is VERY cheap by danish
standards. (#include<standardcomplaint.tax> :-( ).

Well, I have to stop rambling. Let's hear more about homebrewed
hardware-projects on this group. See you next time on the Newsshow.

Uh... guys? Did you hear him say what I just heard him say?
Did Alan just say that there's ONLY ONE PERSON WORKING ON THE WORST PROBLEM
THEIR MACHINE HAS?
Just how small an operation is Atari, anyway?
(Actually, my guess is EVERYONE else is working on the 40-folder bug on the
Transputer box...)

When the fix is made, maybe I'll buy an Atari. I still have a certain
amount of faith in Atari's ability to deliver a decent value, despite all
the griping I've seen on this group since the ST came out.

>
> I *am* working on it, so don't despair. When the fix comes out, it will
> be more sweeping than you think (unless you think big).

Hmm. Does this suggest upcoming compatibility problems?
Or perhaps the advent of a new operating system altogether?
Could it be... MULTITASKING? Okay guys, warm up the rumor mills...

I have the new ("blitter") ROMs in my 1040, and have noticed the same behavior
when booting (I have a Supra disk, with their hard disk boot program
installed). Anyone have a guess as to why? (hello, apratt?)

> >I am also using GEMBOOT to overcome the 40 folder limit in TOS(has it been
> >fixed with the new ROMS?).

> I'm also interested on this question, and it has been already asked a couple
> of times with no visible answer. I've never used the old ROMs, so I don't
> know what the infamous "40 folder limit" means. I've had more than 40 folders
> on my hard disk and nothing happened. Does this mean that the problem is
> fixed? Or is it 40 folders DEEP?

Au contraire, the question has been answered here before in a definitive
manner. That answer is: NO The blitter ROMs do not fix the 40 folder bug.

The 40 folder bug refers to a problem where a filesystem on a hard disk or
diskette can become corrupted if more than 40 folders are accessed during
any one "session" with an ST ("session": period of use between re-boots).
A well-known workaround is the recently re-posted FOLDRXXX.PRG. Change XXX
in the program name to the number of folders you think you're likeky to
access during any one use of the machine, and stick the program in your
\AUTO folder, and re-boot.

I have heard from other netters that this bug is due to memory not being
freed-up when you jumo into and out of folders (directories). Correct
me if I'm wrong on that...

Just to add further confusion to this discussion...
I'm pretty sure that EIA RS-232c is just a hardware spec, eg., voltage
swing, line assignments, line loading, maximum line length, etc.
I don't believe there's anything in the spec about transmission protocols,
but I admit that the term RS-232 seems to have taken on a broader
colloquial meaning.

If those are the same ROMs that they are selling us developers, then the
answer is NO, the "40 folder bug" still exists, and the magazine article
is incorrect.

Neil: please jump in here if if the ROM upgrade for the 520/1040 is different
than what is in the Megas. I understand they are the same.

Subject: Re: Multi-tasking?
To: info-atari16@score.stanford.edu

Most PEOPLE don't multitask on a computer, they task-switch.

HOWEVER! Having multitasking available allows one to write (and use)
programs that multitask internally - sending messages back and forth
to each other, processing things concurrently rather than serially.
Many nice programs on multi-tasking machines just aren't possible on
any single-tasking machine because they INTERNALLY take advantage of
the machine's ability to multi-task and message-pass. Examples on
request, by E-mail.

As a user, MultiFinder is all I want, in most cases. But n

Unfortunately, even if you adhere completely to the standard, half the devices
in the world still won't talk to you without a breakout-box or cable
switching. When the only devices extant were computers and terminals, that was
no big deal, but tell me, how about hooking up a terminal concentrator/network
node to printers, computers, terminals, ... We're talking BIG-time troubles
here, we're talking about cabling nightmares to end all nightmares, even if
the standard IS followed (and it usually isn't -- e.g. a switcher which
arbitrarily decides to ignore an outgoing line if certain transitions don't
occure at certain times, and a network node which refuses to give the switcher
those transitions -- thus FUbaring things horribly.).

I hated having to mutilate my cable to flop RxD and TxD when I hooked up an
Amiga to a C-64 to transfer files at 9600 baud (yes, there's some magic
involved :-).

>
>That is definitely NOT true. The SH204 and SH205 do indeed return with
>an error flagged when one occurs.
>
>Jim Tittsler, Atari Corporation

If this is true, there's some pretty lousy software inside the ST.
Some time ago, a friend of mine connected a 40Mb drive instead of the 20Mb
inside the 204, and, in the process of finding out how big it was, he noted
that he could format 40Mb, 60Mb, 100Mb, etc etc etc. So, we blamed the
drive and repeated the process with the standard one. Same thing.
You can format a SH204 as 4 10Mb partitions. No problem. You can even write
files onto the third and fourth partitions. No errors. Of course, reading
the files again proved to be rather disappointing.

Since that time, I've started to be *very* careful with my SH204......

I can't count how many non-technical types I've shown Amy and they have
no problem comprehending what multitasking can do for them if they are
given a few examples. Once the light goes on they tend to use it often.
Heck, I don't even need to show then Amy - 4 or 5 well chosen sentences
does the trick. Which is why I am really dissapointed (to put it mildly)
that C= has not run commercials that help people to see the light. That
should be easy to accomplish in a 60 second spot, maybe even in 30 seconds.
Peter's commercial idea with Big Blue, Mac, Amy, and the flunky was a
classical case in point.

Subject: WordPerfect on ST
To: info-atari16@score.stanford.edu

Hey everyone! I'm looking for someone who has (or has used) WordPefect on
the Atari-ST. I'm thinking of buying this software!

I would be interested in the following:

1. How much faster (if any) is it than WordWriter-ST?

2. Is the spelling checker better than WordWriter-ST or Thunder?

3. Is the GEM interface good?

4. Are there Keyboard Equavilents to the Mouse/Gem commands?

5. Any other opinions or comments RE: Wordproccesing on the ATARI-ST

Thanks a bunch, and MERRY CHRISTMASS!!!!!!!!!!!!!!!!

Subject: Abaq Developer Kits
To: info-atari16@score.stanford.edu

Before my mailbox overflows:

There is a program in place for Abaq developers. In the USA, you can get information on what documentation will be available, and a more complete look at the Abaq itself, from Atari. In the UK you should go right to Perihelion.

To get the information package, write to:

Atari Corp.
1196 Borregas Ave.
Sunnyvale, CA 94086
Attn: Cindy Claveran

To become a registered developer of the Abaq, you can get the documentation package and get news of when developer units will be available. The cost is $100, sent to the same person listed above.

From: ravi@mcnc.org (Ravi Subrahmanyan)
Subject: Info atari instructions.
To: info-atari16@score.stanford.edu

This message contains the latest info-atari instructions to subscribers. Please go through it (even seasoned users!) and retain for future reference. Of special interest to BITNET users (and interent users with access to bitnet) is a section on accessing the 16-bit program libraries at the Univ of Houston.

The info-atari moderators.

Welcome To Info-Atari.

1. Sending Messages

You may send messages to all "subscribers" by address-
ing it to

info-atari8@score.stanford.edu

and/or

info-atari16@score.stanford.edu

Administrative messages should be sent to

info-atari{8,16}-request.

Please do NOT send general messages to this address. Your
moderators get enough mail as it is!

2. Ground Rules

All messages should be in good taste. Commercial mes-
sages and advertisements are not permitted. When answering a
question, please consider carefully whether the answer
should go to the whole list, or just to the person who asked
the question.

The following ground rules should make the use of this
(or of any other) mailing list much easier:

* never send a message that a totally irrelevant to the
mailing list's purpose to a mailing list. This espe-
cially includes any expressions of irritation at
another list member.

* never forward a message that is totally irrelevant to
the mailing list's purpose to a mailing list.

* when replying to a message on a mailing list, reply
only to the sender of the message unless the reply is
of interest to the entire mailing list.

* avoid inserting the message being replied to in a
reply, especially in a message going to a mailing list.
The context of the reply should be clear from *your*
reply and from various mailer functionalities such as
Message-ID.

* when replying to an earlier reply that violates the
previous rule, ABSOLUTELY DO NOT make matters worse by
adding your own violation.

3. Archives

Archives are kept in several places in formats avail-
able to everyone. As described below, if you are on

ARPANET/DDN you will probably find it more convenient to retrieve files from the archive on radc-softvax.arpa using FTP. If you are not on ARPANET/DDN, or are unable to use FTP, you will be able to retrieve files from archives distributed over several Bitnet hosts by sending mail (notes) to a program called LISTSERV.

3.1. Archives on radc-softvax.arpa

Files from radc-softvax.arpa are available by FTP. FTP will work only for hosts directly connected to ARPANET/DDN. Please obtain local documentation and advice for the FTP user programming running on your host. There are two directories under the anonymous account. One for atari8 and one for atari16.

FTP to radc-softvax using login:guest and password:guest. To get the current list of available atari16 files do a 'get atari16/files.doc'. All of the atari16 files are stored in the atari16 subdirectory. If you need any other information, contact Marc Poulin.

The archive is maintained by Rodney Peck (Peck@radc-multics.arpa) and Marc Poulin (Poulin@radc-multics.arpa or Archives@radc-softvax.arpa).

3.2. LISTSERV

LISTSERV provides access to files for everyone who can send mail, independent of their location. Note, however, that intermediate notes have been known to refuse to handle long messages or have damaged them in transit. LISTSERV provides a number of features which you can access by sending mail (note) to LISTSERV. Only the barest minimum are described herein. On Bitnet messages should be sent to your nearest LISTSERV (the one from which you receive the info-atari digests). (If your address is not on Bitnet, an address for file servers is given below.) All mail sent to LISTSERV contains command lines. LISTSERV will respond by return mail. No subject is necessary in such mail. For more information send the command

INFO

3.2.1. List Names

The list_name for 16-bit Ataris is INFO-A16. The list_name for 8-bit Ataris is INFO-A8. These list names are used by Bitnet addressees for subscribing and unsubscribing

and by everyone for obtaining back copies of news digests. The list_names for programs stored in the archives are PROG-A16 and PROG-A8.

3.2.2. (Un)Subscribing

If you are on Bitnet you may add or remove yourself from the distribution list. It would greatly convenience the moderators if you would do so when you no longer wish to receive digests.

The command to join the list is

SUBSCRIBE list_name User_name

The command to remove yourself from the list is

UNSUBSCRIBE list_name

It would be most convenient if users took care of their own subscribing and unsubscribing, but messages to INFO-ATARI-REQUEST{8,16}@SCORE.STANFORD.EDU will still be accepted.

3.2.3. Accessing Program & Digest Archives

All digests are in the archives. There is a separate program library. You can obtain copies of files from LIST-SERV by sending a message in the specified format.

If you are on ARPAnet (or gatewayed to it), your mail concerning 16-bit Atari information should be addressed to

LISTSERV%CANADA01.BITNET@CUNYVM.CUNY.EDU

Mail concerning 8-bit Atari information should be addressed to

LISTSERV%TCSVM.BITNET@CUNYVM.CUNY.EDU

To obtain a list of files in the file server, the com-mand is

INDEX list_name

The command to obtain a specific file is

GET list_name file_name

for example,

GET INFO-A16 87-00076

December 25, 1987

If you want to learn more, send the message

HELP

The moderator of the 8-bit program library is John R. Dunning. This library is not yet available for use, and further information will be posted to both newsgroups as it becomes available.

3.2.4. LISTSERV Moderators

The person to contact if you are having problems (un)subscribing is Harry Williams (harry@marist.bitnet). The moderator of the 16-bit digest archives is Peter Jasper-Fayer (sofpjf@uoguelph.bitnet). The moderator of the 16-bit program archives is Richard Werezak (carson@mcmaster.bitnet). The moderator of the 8-bit archives is John Voigt (sysbjav@tcsvm.bitnet). The moderator of the 8-bit program archives is Arnold de Leon (adeleon@hmcvax.bitnet).

3.2.5. Information Concerning 16-bit Archive Organization

The digests are numbered sequentially as they come in. Sometimes the files arrive here out of order, or with missing ones, or with extra ones or with mail from BITNET users requesting information. Often the moderator has to logon to LISTSERV and re-name the files according to the "Subject:" line within it. Those "Subject:" lines are what end up in the indexes (in both "-A16" lists)

The program files are largely extracts from the digests (INFO-A16). As far as possible, they are numbered the same as the digests they came from. Other programs were inserted somewhere in the list. The numbers of these "inserted" files were selected so that they would appear in the index at about the correct CHRONOLOGICAL sequence. If no programs were included in the digests, and no contributions were received, then those spaces in the index numbers were left blank.

3.2.6. Supplemental information for BITNET users

Bitnet sites normally cannot make a connection to an internet site (such as Score) and FTP files over, so you do not have direct access to the archives on radc-softvax.arpa from your BITNET site. However, BITNET has some sites with all the good stuff, so you can get files from there. The LISTSERV's at CANADA01 and FINHUTC have old digests, and the ATARINET server at Univ of Houston has most of the best programs. You can get to the LISTSERVs by saying

TELL LISTSERV AT FINHUTC GET ATARI FILELIST

December 25, 1987

or

TELL LISTSERV AT CANADA01 GET ATARI FILELIST

to get a list of files. To get a specific file if you
know it's name, you can say

TELL LISTSERV AT <HOSTNAME> GET <FILENAME> <FILETYPE>

To get stuff from the Univ of Houston server, you can
say

TELL UH-INFO AT UHUPVM1 ATARINET HELP

or

TELL UH-INFO AT UHUPVM1 ATARINET INDEX

for further instructions. After you know a file's
name, you can get it by saying

TELL UH-INFO AT UHUPVM1 ATARINET SEND <FILENAME> <FILETYPE>

Contrary to all the comments from user's of Word Perfect in the
negative aspect, I can say that the version I got didn't have all the
bugs that I had seen mentioned. In fact Word Perfect Corp. is
one of the best software makers that I know of. If you OWN the
program, and have a problem with it, and they have a newer version
of it, they will send it to you, second day air sometimes.

This is one software maker that really backs their product!

>If so please advise me.
>(Note: Our machines will be down(ish) from 24th Dec to Jan 5th)

I have replaced the 1040 drives with the newer mech's that are
currently shipped as external drives. Have had no problem with doing this

at all.

If I were you, I would clean the head with Freon TF, and get all the
dust that usually seems to collect inside the drive. This is the main problem
that I have seen in the internal drives, other than the eairly drives having
the write protect to go out, in which case I replaced it with a small micro
toggle switch.

I have seen drives that were running slow, and still read the data
onthe disk fine, but didn't write for ~%$#*(. Also have seen some drives
that didn't write well either and the cause was due to a mechanical problem
with a lever mounted for upper head pressure. Problem was due to this lever
being a little loose and thus making alot of noise (like ball bearings inside)
and just getting this a little tighter lessened the vibrations allowing the
drive to again work well.

One other thing that I noticed was that some drives, lost the
ability to turn the disk at proper speed *if the drive was sitting in the
correct position. When I went and turned the drive over (upside down) to
further look at the problem, the problem was gone! Turn the drive back over
and the problem returned, turn it upside down, and the drive worked fine
again. Weird problem. Unfortunatly, the direct drive motor for turning the
media is not available from Atari, so a new drive was installed. One of the
newer external ones. Problem solved....

> I changed the disk. I am assuming that the disk drive has not reported
> media change to the ST so it doen't think that there might have been
> a switch.
>
>Now to my main question:
> What in the Atari drives senses the change of media?????????!!????
> And how does the drive signal this to the ST?????
>
>Thanks in advance for any help,
>
>Greg Welych.

A couple of months back, my 1040ST suddenly blew its internal doublesided floppydrive. Since this was the only drive connected, it was a disaster ! My beloved Babs was (almost) dead. She would eventually boot, and come up with an empty desktop. That's a boring game (it wasn't so :-) at the time). What went wrong, I don't know, I tried plucking everything apart to check for any loose connections etc., but no luck. A custom chip in the drive did get awfully hot though.

To summarize, I found myself in a situation somewhat similar to yours: I had to get a new drive somehow. Not wanting to pay for an original Atari-drive, I came up with a reasonably cheap solution. A little research revealed that the internal drive used a standard Shugart interface (both in terms of signals AND connectors). So the problem could be reduced to finding a (cheap) bare drive equipped with the Shugart interface. That's easy enough. I picked a NEC-drive type 1036A, a drive known for its reliability and quiet operation. It's also smaller than the original Ataridrive (which seems be from Hitachi), so with a little fiddling I managed to get it crammed into place. (I had to make some minor changes to the ST-case). The proof of the pudding ? Well, I removed the old drive, plugged in the new one, turned on the power, and Babs made a successfull boot from disc and has been happily humming ever since.

So to connect another external drive, all it seems one has to do is:

A) Buy a bare drive.

B) Pick up the floppysignals from the ST's external floppy
interface. The connections are as shown (seen from the rear):

11 10 PIN SIGNAL INPUT/OUTPUT
1 read data i
9 8 2 side select o
13 12 3 gnd n.a
7 6 4 index i
14 5 drive 0 select + i
5 4 6 drive 1 select + i
7 gnd n.a
3 2 8 motor on o
1 9 direction o
10 step o
11 write data o
12 write gate o
13 track 00 i
14 write protect i

+ : On the 1040's external floppy interface, only the drive 0 select is
active. It carries the actual drive 1 select signal. That way
the external drive automatically becomes drive B.

The standard Shugart interface (again as seen from the rear) looks
like this:

```
_____________________________________________________
////////////////////////////////////////////////////// <- Edge of
------------------------------------------------------ PCB
: 33 . . . . . . . . 1 :
: 34 . . . . . . . . 2 :
:----------------------:
```

PIN SIGNAL INPUT/OUTPUT PIN SIGNAL INPUT/OUTPUT
2 motor on 1 * i 18 direction i
4 in use * i 20 step i
6 drive select 3 * i 22 write data i
8 index o 24 write gate i
10 drive select 0 + i 26 track 00 o
12 drive select 1 + i 28 write protect o
14 motor on 2/ * i 30 read data o
drive select 2 32 side select i
16 motor on 0 i 34 ready * o

PIN 1-33 are all connected to ground (gnd).

*: Not used by the ST. +: Only one of these should be used. It
might be jumper-configurable which is the active input.

C) Supply the drive with some power. I'm not sure if an 1040's
internal supply can cope with two drives. However, since
3.5 inch drives have a low powerconsumption (my 1036A is
rated at 1.8 W), a simple 5/12 volts powersupply shouldn't
be so costly. The connections looks like this

```
________________________
////////////////////// <- Edge of PCB
----------------------
: ____:-----:____ : 1: +5 v dc
: O O O O : 2: GND
------------------- 3: GND
1 2 3 4 4: +12 v dc
```

D) Add cabinet to your taste.

There's a tiny fly in the ointment, however. (There had to be, right?)
The VBL-interrupt routine in the ST, uses the status of the
WRITEPROTECT-line from the drive to check if the disc has been
ejected. Since the level of this signal is reflected in the
statusregister of the floppydisc-controller, all the VBL-routine has
to do is read the contents of this register from time to time. For
this system to function, the drive has to toggle its WRPROT-line in
some fashion (which i haven't bothered to figure out), whenever the
disc is ejected. This represented no problem in my case, since the
latest version (which was the one I used) of NEC FD1036A, is fully
"ST-modified" and thus plug-in-and-go compatible. I bought my drive in
W-Germany and payed around 220,- DM, which is VERY cheap by danish
standards. (#include<standardcomplaint.tax> :-( ).

Well, I have to stop rambling. Let's hear more about homebrewed
hardware-projects on this group. See you next time on the Newsshow.

Uh... guys? Did you hear him say what I just heard him say?
Did Alan just say that there's ONLY ONE PERSON WORKING ON THE WORST PROBLEM
THEIR MACHINE HAS?
Just how small an operation is Atari, anyway?
(Actually, my guess is EVERYONE else is working on the 40-folder bug on the
Transputer box...)

When the fix is made, maybe I'll buy an Atari. I still have a certain
amount of faith in Atari's ability to deliver a decent value, despite all
the griping I've seen on this group since the ST came out.

>

Hmm. Does this suggest upcoming compatibility problems?
Or perhaps the advent of a new operating system altogether?
Could it be... MULTITASKING? Okay guys, warm up the rumor mills...

I have the new ("blitter") ROMs in my 1040, and have noticed the same behavior when booting (I have a Supra disk, with their hard disk boot program installed). Anyone have a guess as to why? (hello, apratt?)

> >I am also using GEMBOOT to overcome the 40 folder limit in TOS(has it been

> on my hard disk and nothing happened. Does this mean that the problem is
> fixed? Or is it 40 folders DEEP?

Au contraire, the question has been answered here before in a definitive manner. That answer is: NO The blitter ROMs do not fix the 40 folder bug.

The 40 folder bug refers to a problem where a filesystem on a hard disk or diskette can become corrupted if more than 40 folders are accessed during any one "session" with an ST ("session": period of use between re-boots). A well-known workaround is the recently re-posted FOLDRXXX.PRG. Change XXX in the program name to the number of folders you think you're likeky to access during any one use of the machine, and stick the program in your \AUTO folder, and re-boot.

I have heard from other netters that this bug is due to memory not being freed-up when you jumo into and out of folders (directories). Correct me if I'm wrong on that...

>where MIDI is specialized so that it can only be used for music. If

Just to add further confusion to this discussion...
I'm pretty sure that EIA RS-232c is just a hardware spec, eg., voltage
swing, line assignments, line loading, maximum line length, etc.
I don't believe there's anything in the spec about transmission protocols,
but I admit that the term RS-232 seems to have taken on a broader
colloquial meaning.

If those are the same ROMs that they are selling us developers, then the
answer is NO, the "40 folder bug" still exists, and the magazine article
is incorrect.

Neil: please jump in here if if the ROM upgrade for the 520/1040 is different
than what is in the Megas. I understand they are the same.

Subject: Re: Multi-tasking?
To: info-atari16@score.stanford.edu

Most PEOPLE don't multitask on a computer, they task-switch.

HOWEVER! Having multitasking available allows one to write (and use)
programs that multitask internally - sending messages back and forth
to each other, processing things concurrently rather than serially.
Many nice programs on multi-tasking machines just aren't possible on

any single-tasking machine because they INTERNALLY take advantage of
the machine's ability to multi-task and message-pass. Examples on
request, by E-mail.

As a user, MultiFinder is all I want, in most cases. But n

Unfortunately, even if you adhere completely to the standard, half the devices
in the world still won't talk to you without a breakout-box or cable
switching. When the only devices extant were computers and terminals, that was
no big deal, but tell me, how about hooking up a terminal concentrator/network
node to printers, computers, terminals, ... We're talking BIG-time troubles
here, we're talking about cabling nightmares to end all nightmares, even if
the standard IS followed (and it usually isn't -- e.g. a switcher which
arbitrarily decides to ignore an outgoing line if certain transitions don't
occure at certain times, and a network node which refuses to give the switcher
those transitions -- thus FUbaring things horribly.).

I hated having to mutilate my cable to flop RxD and TxD when I hooked up an
Amiga to a C-64 to transfer files at 9600 baud (yes, there's some magic
involved :-).

> uw-beaver!tikal!ssc!fyl or uunet!pilchuck!ssc!fyl or attmail!ssc!fyl

agreeded, I alway felt the advantages of the BMS solution were:

1. It came with a battery backed-up real time clock

2. It supports two hard disks on the same controller

3. If and when i wanted to upgrade to a larger disk, i just unplugged
the old one and plugged the new one in

as to cost, be creative, most cities support at least one good used
electronic surplus/salvage store

From: denbeste@bbn.com (Steven Den Beste)
Subject: A defense of Multi-tasking
To: info-atari16@score.stanford.edu

The original poster of this subject asked if there was a place where
multi-tasking was "essential". Many people responded with ways to use
multi-tasking, and the original poster always responded with one of two
answers:

1. There are other ways to do that that don't involve multi-tasking.
Multi-tasking therefore isn't essential for that task.
2. Only sophisticated users would want to do that. (He called them "Power
users.)

[Well, actually, there was a third answer used a couple of times:
3. Why are you being so abusive in a publicly posted article? Why didn't
you mail it to me so I could ignore it?
But that's not relevant to the subject...]

Let's get one thing straight. Multi-tasking is not "essential".

Neither are high-level languages. You can do anything in assembly language you
can do in C or BASIC, but it is less convenient. (MUCH less convenient.)

Nor are icons. People survived for years with text-only computer interfaces.

[For that matter, assemblers aren't "essential" either - you can key in machine
language directly in hex. And if you really want to get down to it, the
computer itself isn't "essential".]

I'm not suggesting that multi-tasking is as important as high level languages.
That's not the point. I _am_ saying that requiring a feature to be "essential"
to be included is a ridiculous criterion. The proper criteria are "useful"
and "convenient".

On the Mac, there are many programs which can run simultaneously. To do this, however, they must be written in a very special way and the operating system must be specifically informed of each.

This is certainly an approach, and it seems to work for the Mac owners. There are certain special cases on the ST, I am sure, where more than one thing can happen at the same time (like a print spooler, for instance) - again it is done specially.

On a general purpose multi-tasker, ANY two programs can run simultaneously, unless one of them is being a particularly bad citizen. Though this isn't "essential", isn't that more convenient?

Which brings us to the second argument: Even if multi-tasking is indeed useful and convenient, it still won't be used by the great unwashed (called typical users in the original posting). Only "power users" would use it.

I don't quite understand why that means a feature should be omitted. Is it being suggested that a feature should only be included in a product if EVERY OWNER of that product will use it?

More importantly, it assumes that the users won't mature and become more sophisticated. Though a user may not use a feature when the product is first purchased, many times the user will grow into it as time progresses. "Power users" all began as unsophisticated users.

However, they won't mature if the machine they are on won't let them. I used to know quite a few owners of TRS Model I's, who were wizard Basic programmers, but were so restricted otherwise by the machine, that they might now never grow out of it, even if now given a better system.

In many ways, it is desirable that a machine provide some advanced features that the new user won't immediately use, so as to provide room for maturation and learning...

..providing it is done so that the user isn't forced to use this feature before ready.

Which leads me to the last point: The original poster stated, but never justified, a belief that providing multi-tasking was not merely useless but actually undesirable. I don't see it.

If:
1. Multi-tasking doesn't add to the purchase price of the product
2. It isn't intrusive on people who don't understand or need it right now
3. It is available for those who do understand it, or those who grow into it

Then
I state that it is an unmixed asset and should be in the product. I would be very interested in hearing why, given these three assumptions, multi-tasking should be omitted from a product.

If you change any of the assumptions, then you are arguing against a strawman. All three of them are true for multi-tasking on the Amiga.

If you say "There are other ways" that is irrelevant. The point is not to show alternatives, but to actually demonstrate that multi-tasking is a negative thing in its own right.

If you cannot demonstrate that it is an actual danger, then it is merely useless for most (but not all!) users. But since, by the assumptions, it doesn't impede those users who don't use it, then its ability to attract "power users" makes it an asset. (It attracted me - it is the main reason I bought the Amiga.) (By the way, by so doing it represents an indirect asset for those unsophisticated users, because the "power users" are cranking out public domain software which the unsophisticated users can get for free. 120 880K Fish-disks at last count.)

We therefore have three classes of users for the multi-tasking machine:

1. Those who don't understand and won't use multi-tasking, but are not impeded by it. [If you think they are impeded, then we are out of the realm of the theory and into fact. I state as a fact that it does not impede rank amateurs on the Amiga.]

2. Those who don't understand it to begin with, but grow into it.

3. Those who understand it and use it from the very beginning.

Group 1 isn't bothered by its presence. Group 2 and Group 3 benefit by it. How can it be a bad thing?

Which brings us finally to the issue of the motive of the original poster. Let's try some syllogisms, shall we?

1. The Atari ST is an ideal computer
2. The Atari ST doesn't have multi-tasking
ERGO Ideal computers don't require multi-tasking.

1. If several machines offer multi-tasking, people will grow to expect it.
2. If people grow to expect it, they will refuse to buy machines not having it.
ERGO If several machines offer multi-tasking, the public will refuse to buy machines not having it.

1. If several machines offer multi-tasking, the public will refuse to buy machines not having multi-tasking.
2. The Atari ST doesn't have multi-tasking.
ERGO If several machines offer multi-tasking, Atari ST sales will suffer.

1. Anything which causes Atari ST sales to suffer is dangerous.
2. If several machines offer multi-tasking, Atari ST sales will suffer.
ERGO It is dangerous for other machines to offer multi-tasking.

Could these be the real reasons behind the original posting? Or maybe just a deliberate attempt to stir up trouble?

From: SARGON%UMass.BITNET@forsythe.stanford.edu
Subject: A different view on multitasking.
To: info-atari16@score.stanford.edu

In light of the humorous (if not entirely short sighted) notes on the usefulness of multitasking to the "average" microcomputer user I thought Id toss in some historically relevant views..

1. A microcomputer user will never need anything more than a few cassette tapes to hold his work.

2. A microcomputer user will never need anything but a TV set to display information from a computer.

3. A microcomputer user will never need even as much as 64K of memory.

4. A microcomputer user will never need a language other than interpretive BASIC to perform any task.

Last time I heard the Atari 1040ST came with an 800K floppy disk drive, requires a monitor (as Atari didnt put the modulator in there), comes stock with 1MB of RAM and doesnt come stock with BASIC. Does this make the designers at Atari morons for putting in such useless junk? I think not.

Finally, your "average" user of a modern microcomputer (this gets rid of the Apple II and C64 crowds) is more likely to be in a business or higher education setting than in the kitchen as a $x000 recipie file. Both of these areas are demanding the ability to share and distribute information. This means networks. Networks need software drivers that requires a certain degree of multitasking. Im sure Atari the self proclaimed "vertically integrated" computer maker will be (or hopefully IS) working on both multitasking and networking. The 286/386 and the 030 all have memory management hardware whether you use it or not. Why not use it?

I agree with Mr. Storin's main point fully, and moreover think that Joe Average will, unless he's very careful, actually *learn* something about what his computer can do and take advantage of multitasking eventually, but--I think that a visit to a friend or neighbor with a CoCo 3 running OS-9 will show that one can have multitasking on an 8-bit machine. (Much less a visit to a place with a dozen folks hacking merrily away on a Gimix 6809-based computer.)

>
> -- Dave Meile

I normally avoid religious wars, but this is too much. Just who are these mythical "non-power-users" that don't need multi-tasking. Everyone is trying to convince you that they don't exist. I'll tell you what. You show joe user what muti-tasking can do and then tell him that he is too unsophisticated to use it. Then duck. Manufacturers who underestimate buyers go out of business. If "joe user" couldn't use multi-tasking, we would not have kludgo simulations (TSR's, desk accessories, etc.). As one of my co-workers posted, it is only a matter of education. Joe user expects magic from a computer. As soon as he realizes a computer can't do two things at once, like he can, he'll be unhappy. He wants multi-tasking.

And I'm not picking a bone for the Amiga over the Atari. Note my employer. We only support one of those two machines. And its not the Amiga.

Sorry, no cute signature file.
Andy Nicholson

Why are comp.sys.mac and comp.sys.ibm being cluttered up with this stuff?
Atari ST binaries, never the less. Please, show some restraint in what
news groups you post this stuff to. It doesn't do us much good to receive
useless ST binaries in comp.sys.mac or comp.sys.ibm!

I can't count how many non-technical types I've shown Amy and they have
no problem comprehending what multitasking can do for them if they are
given a few examples. Once the light goes on they tend to use it often.
Heck, I don't even need to show then Amy - 4 or 5 well chosen sentences
does the trick. Which is why I am really dissapointed (to put it mildly)
that C= has not run commercials that help people to see the light. That
should be easy to accomplish in a 60 second spot, maybe even in 30 seconds.
Peter's commercial idea with Big Blue, Mac, Amy, and the flunky was a
classical case in point.

Subject: WordPerfect on ST
To: info-atari16@score.stanford.edu

Hey everyone! I'm looking for someone who has (or has used) WordPefect on
the Atari-ST. I'm thinking of buying this software!

I would be interested in the following:

1. How much faster (if any) is it than WordWriter-ST?

2. Is the spelling checker better than WordWriter-ST or Thunder?

3. Is the GEM interface good?

4. Are there Keyboard Equavilents to the Mouse/Gem commands?

5. Any other opinions or comments RE: Wordproccesing on the ATARI-ST

Thanks a bunch, and MERRY CHRISTMASS!!!!!!!!!!!!!!!!

From: portal!atari!neil@uunet.uu.net (Neil Harris)
Subject: Abaq Developer Kits
To: info-atari16@score.stanford.edu

Before my mailbox overflows:

There is a program in place for Abaq developers. In the USA, you can get information on what documentation will be available, and a more complete look at the Abaq itself, from Atari. In the UK you should go right to Perihelion.

To get the information package, write to:

Atari Corp.
1196 Borregas Ave.
Sunnyvale, CA 94086
Attn: Cindy Claveran

To become a registered developer of the Abaq, you can get the documentation package and get news of when developer units will be available. The cost is $100, sent to the same person listed above.

Date: 25 Dec 87 15:40:24 GMT
From: ravi@mcnc.org (Ravi Subrahmanyan)
Subject: Info atari instructions.
To: info-atari16@score.stanford.edu

This message contains the latest info-atari instructions to subscribers. Please go through it (even seasoned users!) and retain for future reference. Of special interest to BITNET users (and interent users with access to bitnet) is a section on accessing the 16-bit program libraries at the Univ of Houston.

The info-atari moderators.

Welcome To Info-Atari.

1. Sending Messages

You may send messages to all "subscribers" by address-
ing it to

info-atari8@score.stanford.edu

and/or

info-atari16@score.stanford.edu

Administrative messages should be sent to

info-atari{8,16}-request.

Please do NOT send general messages to this address. Your moderators get enough mail as it is!

2. Ground Rules

All messages should be in good taste. Commercial messages and advertisements are not permitted. When answering a question, please consider carefully whether the answer should go to the whole list, or just to the person who asked the question.

The following ground rules should make the use of this (or of any other) mailing list much easier:

* never send a message that a totally irrelevant to the mailing list's purpose to a mailing list. This especially includes any expressions of irritation at another list member.

* never forward a message that is totally irrelevant to the mailing list's purpose to a mailing list.

* when replying to a message on a mailing list, reply only to the sender of the message unless the reply is of interest to the entire mailing list.

* avoid inserting the message being replied to in a reply, especially in a message going to a mailing list. The context of the reply should be clear from *your* reply and from various mailer functionalities such as Message-ID.

* when replying to an earlier reply that violates the previous rule, ABSOLUTELY DO NOT make matters worse by adding your own violation.

December 25, 1987

- 2 -

3. Archives

Archives are kept in several places in formats available to everyone. As described below, if you are on ARPANET/DDN you will probably find it more convenient to retrieve files from the archive on radc-softvax.arpa using FTP. If you are not on ARPANET/DDN, or are unable to use FTP, you will be able to retrieve files from archives distributed over several Bitnet hosts by sending mail (notes) to a program called LISTSERV.

3.1. Archives on radc-softvax.arpa

Files from radc-softvax.arpa are available by FTP. FTP will work only for hosts directly connected to ARPANET/DDN. Please obtain local documentation and advice for the FTP user programming running on your host. There are two directories under the anonymous account. One for atari8 and one for atari16.

FTP to radc-softvax using login:guest and password:guest. To get the current list of available atari16 files do a 'get atari16/files.doc'. All of the atari16 files are stored in the atari16 subdirectory. If you need any other information, contact Marc Poulin.

The archive is maintained by Rodney Peck (Peck@radc-multics.arpa) and Marc Poulin (Poulin@radc-multics.arpa or Archives@radc-softvax.arpa).

3.2. LISTSERV

LISTSERV provides access to files for everyone who can send mail, independent of their location. Note, however, that intermediate notes have been known to refuse to handle long messages or have damaged them in transit. LISTSERV provides a number of features which you can access by sending mail (note) to LISTSERV. Only the barest minimum are described herein. On Bitnet messages should be sent to your nearest LISTSERV (the one from which you receive the info-atari digests). (If your address is not on Bitnet, an address for file servers is given below.) All mail sent to LISTSERV contains command lines. LISTSERV will respond by return mail. No subject is necessary in such mail. For more information send the command

INFO

3.2.1. List Names

The list_name for 16-bit Ataris is INFO-A16. The list_name for 8-bit Ataris is INFO-A8. These list names are used by Bitnet addressees for subscribing and unsubscribing

and by everyone for obtaining back copies of news digests. The list_names for programs stored in the archives are PROG-A16 and PROG-A8.

3.2.2. (Un)Subscribing

If you are on Bitnet you may add or remove yourself from the distribution list. It would greatly convenience

the moderators if you would do so when you no longer wish to receive digests.

The command to join the list is

SUBSCRIBE list_name User_name

The command to remove yourself from the list is

UNSUBSCRIBE list_name

It would be most convenient if users took care of their own subscribing and unsubscribing, but messages to INFO-ATARI-REQUEST{8,16}@SCORE.STANFORD.EDU will still be accepted.

3.2.3. Accessing Program & Digest Archives

All digests are in the archives. There is a separate program library. You can obtain copies of files from LIST-SERV by sending a message in the specified format.

If you are on ARPAnet (or gatewayed to it), your mail concerning 16-bit Atari information should be addressed to

LISTSERV%CANADA01.BITNET@CUNYVM.CUNY.EDU

Mail concerning 8-bit Atari information should be addressed to

LISTSERV%TCSVM.BITNET@CUNYVM.CUNY.EDU

To obtain a list of files in the file server, the com-mand is

INDEX list_name

The command to obtain a specific file is

GET list_name file_name

for example,

GET INFO-A16 87-00076

December 25, 1987

If you want to learn more, send the message

HELP

The moderator of the 8-bit program library is John R. Dunning. This library is not yet available for use, and further information will be posted to both newsgroups as it becomes available.

3.2.4. LISTSERV Moderators

The person to contact if you are having problems (un)subscribing is Harry Williams (harry@marist.bitnet). The moderator of the 16-bit digest archives is Peter Jasper-Fayer (sofpjf@uoguelph.bitnet). The moderator of the 16-bit program archives is Richard Werezak (carson@mcmaster.bitnet). The moderator of the 8-bit archives is John Voigt (sysbjav@tcsvm.bitnet). The moderator of the 8-bit program archives is Arnold de Leon (adeleon@hmcvax.bitnet).

3.2.5. Information Concerning 16-bit Archive Organization

The digests are numbered sequentially as they come in. Sometimes the files arrive here out of order, or with missing ones, or with extra ones or with mail from BITNET users requesting information. Often the moderator has to logon to LISTSERV and re-name the files according to the "Subject:" line within it. Those "Subject:" lines are what end up in the indexes (in both "-A16" lists)

The program files are largely extracts from the digests (INFO-A16). As far as possible, they are numbered the same as the digests they came from. Other programs were inserted somewhere in the list. The numbers of these "inserted" files were selected so that they would appear in the index at about the correct CHRONOLOGICAL sequence. If no programs were included in the digests, and no contributions were received, then those spaces in the index numbers were left blank.

3.2.6. Supplemental information for BITNET users

Bitnet sites normally cannot make a connection to an internet site (such as Score) and FTP files over, so you do not have direct access to the archives on radc-softvax.arpa from your BITNET site. However, BITNET has some sites with all the good stuff, so you can get files from there. The LISTSERV's at CANADA01 and FINHUTC have old digests, and the ATARINET server at Univ of Houston has most of the best programs. You can get to the LISTSERVs by saying

TELL LISTSERV AT FINHUTC GET ATARI FILELIST

December 25, 1987

- 5 -

or

TELL LISTSERV AT CANADA01 GET ATARI FILELIST

to get a list of files. To get a specific file if you know it's name, you can say

TELL LISTSERV AT <HOSTNAME> GET <FILENAME> <FILETYPE>

To get stuff from the Univ of Houston server, you can
say

TELL UH-INFO AT UHUPVM1 ATARINET HELP

or

TELL UH-INFO AT UHUPVM1 ATARINET INDEX

for further instructions. After you know a file's
name, you can get it by saying

TELL UH-INFO AT UHUPVM1 ATARINET SEND <FILENAME> <FILETYPE>

Contrary to all the comments from user's of Word Perfect in the
negative aspect, I can say that the version I got didn't have all the
bugs that I had seen mentioned. In fact Word Perfect Corp. is

one of the best software makers that I know of. If you OWN the
program, and have a problem with it, and they have a newer version
of it, they will send it to you, second day air sometimes.

This is one software maker that really backs their product!

>different drive in their 1040 or repaired the original one?
>If so please advise me.
>(Note: Our machines will be down(ish) from 24th Dec to Jan 5th)

I have replaced the 1040 drives with the newer mech's that are
currently shipped as external drives. Have had no problem with doing this
at all.

If I were you, I would clean the head with Freon TF, and get all the
dust that usually seems to collect inside the drive. This is the main problem
that I have seen in the internal drives, other than the eairly drives having

the write protect to go out, in which case I replaced it with a small micro toggle switch.

I have seen drives that were running slow, and still read the data onthe disk fine, but didn't write for ^%$#*(. Also have seen some drives that didn't write well either and the cause was due to a mechanical problem with a lever mounted for upper head pressure. Problem was due to this lever being a little loose and thus making alot of noise (like ball bearings inside) and just getting this a little tighter lessened the vibrations allowing the drive to again work well.

One other thing that I noticed was that some drives, lost the ability to turn the disk at proper speed *if the drive was sitting in the correct position. When I went and turned the drive over (upside down) to further look at the problem, the problem was gone! Turn the drive back over and the problem returned, turn it upside down, and the drive worked fine again. Weird problem. Unfortunatly, the direct drive motor for turning the media is not available from Atari, so a new drive was installed. One of the newer external ones. Problem solved....

From: dwyer@inmet.UUCP
Message-ID: <148900002@inmet>
Source record: 255217

I recently bought a SUPRA 2400 baud modem. It seems to work just fine.
I cannot comment on reliability, because of my limited experience with
it. I can say however that 2400 baud makes working remotely possible, where
1200 did not. It is possible to do full-screen editing and remain sane.

There are a number of possible reasons that the SUPRA modem is inexpensive.
It is not in a fancy box, there aren't lots of pretty lights and nobs.
It does not, at least the package I bought, come with communication
software.

We're talking semantics here. I know you can leave private "email" in
STadel, but you can't leave a public "message" addressed to someone.

I have a better offer for Atarians.
Post your flames about how useless multi-tasking is to
the Coco newsgroup comp.sys.m6809.
We'd be glad to have the extra traffic.
And to tell you how great it is to have a multi-tasking
OS9 Level 2 with windows and graphics, all on a $129 "toy"
computer from Radio Shack.
I like compiling, editing 2 files, and printing all at once.
And I'm reminded of this when I have to use a PClone
and can't just go to another window from the program I'm
running, which never seems to have a shell escape either
(Shell? In MSDOS? Sorry, another OS/9 term slipped in..)

One point that has been a bit overlooked by the Desk Accessory/Pop-Up Utility
crowd -- why be forced to "make do" with the limitations that a Desk Accessory
imposes? NOT to suggest that the Desk Accessory are not useful, or that the
programming done by their authors is somehow lacking; what I DO mean is that
in a multi-tasking environment I have my CHOICE of any number of full featured
```

programs, all of which run together (within the limits of my systems resources, of course.) So I can use the same word processor and outline processor and spreadsheet and etc. that I always use, rather than one that can run as a Desk Accessory (and thus is used mainly for just that reason.)

When I started working as an advisor at UofT, TSO was the main system besides batch card jobs through JCL. Back then if you mentioned a Micro, you were laued at and told they could never do what a BIG machine could do. Too bad I have to use unix on a this SUN toy now instead of a 370 !!
Whats this have to do with multi-tasking? I'm not sure but the whole argument seems kinda stupid. Buy what you want. I have an atari for games and an IBM for programming and cad work. It would be really nice to have a multitasking Sun 3 but I can get by on less. If multitasking would force(?) programmers to produce better code then I'm all for it !

Agreed...even my worst case program (hdscan) takes less than a minute to compile, so I rarely even have the urge to pop it into the background...

> ... And yes, I know that background print spooler gadgets can
>run on single task DOS's ... I've seen 'em in CP/M, RT-11, Mess-DOS,
>and many many others. But I've never been convinced that they
>ever ran cleanly.

???Why not??? I have less trouble with the automatic print spoolers on my PC clone and ST than I do on the Unix boxes at work. I can prioritize jobs, edit stuff in the queue, etc on the ST version, but those hacks are mostly fluff and rarely used...besides, I have seen those handy little standalone print spoolers going for under $50 nowadays, so that may be a better solution in the long run...

>I'm thinking ahead some time into the future when we'll have
>ISDN running everywhere ... In order to handle network communications
>cleanly we'll need to have multi-tasking.

Umm, by the time we have ISDN running everywhere, our current computers will probably be dust. By then, most of us will probably be running some variant of Unix on our machines if we want to properly utilize ISDN (i.e. we will have BIG drives, some form of USENET access ...which I can't quite picture even two years from now, since we are running about 28MBytes of messages/week now..., very high speed modems, etc.)

>[There are] also things like mail daemons
>and such that recieve e-mail while you're asleep (or away
>or whatever).

UUPC seems to work fine on the ST and I have several STadel (ST citadel) boards that poll my Unix box every couple of hours for uucp mail and the comp.sys.atari.st sections. I am sure there are a lot of Amiga systems doing the same (I recall that UUPC came out for the Amiga and Citadel is also running on the Amiga).

>For right now? Well, how about killing run-away processes?

On the ST OS-9 or the Multi-tasking C shell has the standard ability to do this...And on the Amiga or the ST, you can always hit reset to kill everything, but still keep the things that were out on RAM drives...(I used this feature a lot on both the Amiga and the ST in the early days of using C compilers that were released too soon.)

I agree somewhat with Dave Meile on this discussion/argument. In the long run, the average user of a popular computer is not the 'BBS'-type or a person that needs anything more than a few utilities in the form of desk accessories on top of an application. Unfortunately, the IBM PC and the Mac have gained the 'average' user market, to date. Those of us with Amiga's and Atari ST's are either technical enough to appreciate and use the special features of the respective computer, or we had very, very persuasive friends who convinced us that the Amiga/ST was the best computer. The 'average' user is still the person that just buys a Mac or PC for a very specific purpose (usually for writing memos or doing spreadsheets in a business environment). They may run Lightning/Thunder (real time spelling checkers on the PC/ST) in a pseudo background manner, and have a ton of desk accessories or pop up tools, but they rarely go in for the increased complexity that a multi-tasking environment like DesqView offers on the PC. Even the carrousel approach (there, I just multi-tasked and asked my wife for

a spelling check...it can also be spelled carousel) is somewhat
confusing to people, but I have seen secretaries fall in love with the
carrousel programs on the Mac and the ST...although not on the PC version
for some reason.

There is a very nice PD one for the ST...If I remember right, the docs
for it seemed to indicate that the original 'port' source would work
on any 68000 computer (it has been over a year since I played with
it, so the name of the company that wrote it escapes me). Atari did
put this out as a PD disk, so maybe Neil can help? If not, I'm sure
you could get the disk from your local Atari club...

I recall getting about 1.5MHz to 3Mz throughput on most of the
programs I had from the ATR8000 days...things like Perfect Writer,
Wordstar, Turbo Pascal, etc all worked fine. I even used some of my
wifes software that I copied over from her Geneva portable and it
ran fine (but emulating a 80 char by 8 line display).

I'm glad to see that someone else has discovered this gem of a machine. Around
this neck of the woods (New York) it seems to be selling well and users marvel

at the power, quality and accessories of a printer that sells for a relatively meager $350 to $400. I've used several drivers and wound up with a variety of screen dump sizes but all high quality. Speaking of high quality, if you're into Desktop Publishing this machine will make you think twice about spending all that money on a laser printer.

I've been using that package for a year, and the only bug I've encountered was in the clock setting software, which would cause the clock to freak in February.. it was quite amusing actually, and it was fixed immediately (Chris would actually tell you the location to patch in the executable if you didnt want to wait for him to send you a new disk). No other bugs as far as I know,

Subject: Re: Hard disk boot???
To: info-atari16@score.stanford.edu

The problem you have with holding down the alt-ctrl-shift may have to do with WHEN you hold down the keys. If you bootup with! the keys down, then it will not work with the new ROMs.
Try turning on the machine (or resetting) wait a second, then hold down the keys. This should work.
Don't use GEMBOOT with th[e new ROMs, use foldrxxx.prg instead.

Also, I had the same[problem with the message about a non-supported ROM version. Ignore the message, the driver is actually installed, and works just fine.

Subject: Re: Atari's Marketing Approach
To: info-atari16@score.stanford.edu

Okay, how can you change Atari's image? Does it matter? Sure, more advertise-
ments would be nice, but what benefit do we, the curreniet owners of STs derive
from that? Perhaps it would be a boost to our own egos having more commmercials
on TV. I mean who wants to own a machine that doesn't receive alot of press?
In actuality, I doubt that more TV advertising would do too much good, other
than allowing us to say "I saw the ad five times in one hour," or "Did you
see the ads last night?"

Ask yourself this - how many other computer companies make game machines?
Answer - NONE!
Not Apple, not IBM, not Commodore, no one.
Therefore, Atari is stuck, because they do currently sell game machines.

This is not neccessarily bad, but more advertising, I beleive will only give
us current owners a shot in the arm. Remembere, actions speak louder than
words, and no advertising can boost sales if you don't have an exciting line
of products to sell, and new products on the way. If Atari can produce, then
they zwill be successful. The ABAQ is exciting, but may come out too late to
'steal' the show. Is it important for Atari to come out with products first?
For us owners, we certainly would take a lot of pride in the company if we
were owners of a$ computer from a company that was 'on the leading edge' and
delivered prroducts before anyone else, but what real benefit do we get from
that other than feeding our egos.
So, before you go complaing to Neil, ask who will really benefit. Is this
'commercial wars.' Are we feeling left out? We have a good machine that is
exactl[y what we paid for. What more do you want?

Flame me at this address, if you want. I just get tired of complaining about
immaterial things. If you wanna complain, complain about how GEM is a closed
operating system that must be hacked at to figure out (that's GEM, not TOS).

My opinions are my own, and do not neccessarily reflect our users' group,
company, university, or any living being.

Subject: spectrum 512, MWC, BDT MT C-shell, Alpaha Mega Disk(?)
To: info-atari16@score.stanford.edu

I only had my 1040ST for a week before the drive went and I'm still waiting for it to come back so in the meantime I thought I'd ask a few questions.

I've been reading about Spectrum 512 in Antics START magazine and was wondering if anyone has disassembled the code and found out how they put 48 colors per scan line? Does this code work for putting more colors per scan line in medium rez? Also could anyone out there who owns Spectrum 512 tell me how like/dislike this product?

I plan on buying it just for the feature of 512 colors but I was just wondering how good a paint program this is compared to Degas & NeoChrome.

About how they do it, Spectrum owns the rights to Spectrum 512 not the ability to put 48 colors per scan line. I feel Spectrum has done something that I didn't think was possible and they deserve all the customers they can get, it's just that I hope the how's and why's of the scan line trick become public knowledge, for a person shouldn't have to buy the program just to be able to have 48 colors per scan line on their ST's.

I'm currently using Mark Williams C with Beckemeyers MT C-shell and together they make a pretty powerful programming environment. I was wondering if anyone knows how much temp space both programs use? I set a ramdisk up and put the most used commands from MT C-shell into it (ls, cd etc.) and was wondering how much bigger I should make the ramdisk to hold the /tmp area which MWC & BDT MT C-shell use for temporary storage.

Also while talking about ramdisks has anyone bought the Mega disk(?) by Alpha. It's suppose to be a 1 meg. ram cartridge which plugs into the cartrige port on the Atari and gives you the ability to have an 800k ramdisk + 200k printer spooler or two 400k ramdisks and the printer spooler. Also included for $299 is a power supply so that after you turn your computer off your data is still intact, sort of like a mini Hard Drive. For the price it sounds good, if anyone has bought one could you tell me how you like it and also how could I get MT C-shell to recognize the 200k printer spooler?

Thanks in advance

Merry Christmas & Happy Holidays to all

Subject: Text -> Speech Programs
To: info-atari16@score.stanford.edu

I am making this inquiry on behalf of a partially sighted person
who has recently purchased an Atari ST.

What he is looking for is a Text -> Speech conversion program that
would allow him to hear the contents of a text file. I know that there
is a simple speech program available called ST-TALK that performs this
function, but only on text typed from the keyboard.

Does anybody know of a similar program that could read a file of text
and then speak it back? Are there sources available for the aforementioned
ST-TALK that might be modified to make it work on text files?

Please reply to me by mail, unless, of course, you think it is important
enough to post.

Michael Vederman (uace0@uhnix2.UUCP) asks:

> Okay, how can you change Atari's image? Does it matter? Sure,
> more advertisements would be nice, but what benefit do we, the curreniet
> owners of STs derive from that?

The rationale goes as follows:
```

If the advertising is effective, more ST's will be sold, and the installed base will get bigger. This will attract more third party software vendors, who will write more software for the system, which means a better and wider availability of software for those who already owned the machine when the advertising began.

Clear?

I suggest that if you want to learn programming you take a class at a community college or through some other program where they provide the computer. The reason being that the things that make a computer easy to program, and the programs that make a computer useful may be a disjoint set. Have you ever programmed on a ZX81? Not much fun. Or maybe you buy a commodore 64 to learn programming, and then find out that you really want to program in C and no one makes a C compiler for

it. Maybe COBOL is your idea of fun, that wipes out the Atari and Amiga
right there. But the biggest danger is that you may discover you can't
program, or hate to program and now you have this essentially worthless
computer (remember the condition was that you bought it to learn programming).
I know a lot of people who have bought computers, the ones that took a
programming class were a lot happier. You learn a lot about computers
when you take a programming class. It gives you an edge, I heard about
a guy that bought a computer to program on that had only a line oriented
editor because the salesman had convinced him that editors that supported
editing on a "hard copy" terminal were more powerful than screen editors.

> I don't think BBN cares what I think about this stuff.
> And that's probably just as well.

I can see your rational to a point, though I believe that your over
looking one main point.

Atari is looking to get away from the GAME MACHINE image. I think
that this is an excellent idea. BUT,Right now, I hear more people talking to
other's to look at the machine and they refuse to look past the Game Machine
Image that is still attached to the name.

Increasing the user base is a great idea, but remember that most that
do check out the system, are pretty new to computer's for the most part.They
really don't know whats out there for third party software, and when they
do, they see alot of games made for the machine. They also see alot of
owner's talking about the neat games that they have, but when it comes to

what application software is available, well thats where were short. Sure games are fun, and show off the power of the machine, but all this power has to be put to better use!

What I am getting at is third party software parties like Word Perfect Corp., Monogram, and other's to get their software over to the ST and do it right! I'm not really all that choked up about the third party software houses that simply port their stuff over, and it runs like it would on a PC. I would like to see software that really flys, and takes full advantage of the machine. To date their are but a handfull of such programs and for the most part these companies have not seen fit to back up their product with the supprt that is really needed. Word Perfect has been the real exception.

Lets face it. Atari owner's *know what the machine is capable of, and with this knowledge, the demand the software to work correctly, and if it does not, the CO. should make a revision. This is not the case for the most part. Sure there are alot of packages out there that do perform quite well, but still don't make full use of the power that is available. Two markets that suffer quite a bit are the Business and Educational areas. These have been been improving, but were a long way off to where we should be, and where Atari would like it to be (my opinion of course).

I for one, like the idea of Atari buying Federated, and the work being done with the Abaq box. Excellent ways to increase performence, but it still has to be sold to the general public. Business in particular.

Ways for getting the point across.

I would start getting more software out that would 'DO THE JOB' and have my name placed on it (Atari name). Of course the software would have to work to perfection as advertised. Who else better than Atari to make a software product that does the job? They designed the machine, and know it better than anyone else. The software that they have produced, has been outstanding, and proves that fact. (Lets not get into Atari Basic though!) along with the machine, offer software that would help intice the MS-DOS brainwashed people to see the Atari as a viable alternative.

Case in point.

We bought DAK easy accounting from DAK for our business. The program was written in basic, then compiled. Thats not the real problem. The program was really un-supported. The bugs were not fixed, and when the CO. had to face the fact, they come up with deciding not to support the product, and then comming out with version two, state that there is no market for business software for the machine, thus not making the version two available for the ST. Then you get the software emulator, and version two, and the program runs so slow, that for all intence and purposes, is really not usable. Especially when you seen version one (buggy as it is) run as fast as it did, would make anyone cry. If Atari produced this product, the purchaser's would know that the product would be supported, and any bugs (if any) would be corrected.

I stand in the wings that Atari should produce some productivity
software for the machine. What they have produced is great, but what is
really missing is the business and educational software to act as a magnet
to draw more to the power of this fabulous machine.

Subject: big arrays in MW C
To: info-atari16@score.stanford.edu

Hi,
Does anyone know if MWC will safely handle large arrays now? I know
that I had problems in the early versions with HDSCAN's arrays in that
I had to keep the total amount of data in a particular array less than
32K bytes. Now when I compile tests (i.e. a char[10000][12]), I get a
message like:
strict: size of array overflows size_t
which doesn't make sense, since size_t is a long if I remember correctly.
Somewhat confusing (and frustrating now that my manual is out of phase with
the newer version of the compiler that I got recently.)

What I really want to do is fold my Unix version of HDSCAN back into the
ST version, and preferably with MW C. If it looks like it will be too much
of a mess, I will probably wait for the new version of Megamax, since that
sounds somewhat promising as well. (Yes, the Unix version is done...I
am mailing the source code to comp.sources.misc next week. Supports both
BSD and SYSV flavors of Unix).

-Thanks,
Todd Burkey

Subject: Re: Multi-tasking? A nightmare...
To: info-atari16@score.stanford.edu

I still have not heard one counter argument against the value
that multi-tasking has as a tool for the programmer to use to
write better programs. Perhaps the user does not see this as
multi-tasking, but benfits from it none the less. After all,
this is a powerful tool and we programmers can use it to make
what would otherwise be a difficult task an easy one. This
this translates to less expensive or more feature full programs.

I have never said that multi-tasking was "essential". However,
it is a VERY powerfull and usefull tool for both the software
developer and the user alike. And you need not use it if it is
too much for you.

As far as this OS/9 buisness goes, if it were being distributed
free then it might mean something, but from what's been said it
will be held by only a small fraction of the ST users due to its
price. Thus programmers will not be able to consider the bulk of
the ST market when depending on OS/9, and will not be likely to
do so. So much easier when its included with the basic system!

Thanks, Happy New Year,

Wade.

Let's face it, even a Timex Sinclair with 16K of RAM can do all of the above (just a bit slow and limited). A boat-anchor CP/M system can also do all of the above, and would be cheaper (nowadays) besides. But I sure the hell don't like to use one after I've used BSD4.2 & other OS's that take advantage of multitasking.

For example, take the term paper. I'm using an 8-bit single-tasking system right now. I set it to printing. Then I go away for 20 minutes while my NX-10 bangs away in near letter quality mode (more "near" than "letter", but that's the breaks!). That irritates me. Greatly. There's a couple of things I could do here: Use my RAM-disk and jam a software interrupt-driven spooler on my LST: device (multitasking!), go out and buy a 512K print spooler (multitasking again, although in this case with a dedicated processor), or any other number of things. All of which are multitasking. All of which are a kludge, and would be unnecessary if real multitasking was available.

I remember my first computer. 5K of RAM, 16K of ROM, I was in hawg heaven, a computer all my own, to hack in 6502 assembly language on. I lusted for 16K, because with 16K, you can do anything, right? 64K? forget it, 64K was for rich folks with $2,000 to buy the latest CP/M boat-anchor (so-called because of its size and weight, in this case :-). Disk drives? Why would anybody want disk drives? I can load and save just fine with my cassette recorder!

Then I moved up to a 64K machine with a disk drive. Wow. Big time now. I'll never take that 5K machine out of the closet again (even tho I expanded it to 16K). After all, it's just an obsolete toy now, right? and 64K... I can do ANYTHING! Wow, what power. Why would I want one of them fancy dandy 68000 machines, 'specially when they all cost $5,000 for 256K of RAM, and I can do everything they can, on my li'l min-anchor? I mean, I can process words, I can write programs, I can play games... they do all that, right?

There's 2 points I wish to make:
1) Some features added to the computer make it more productive and easier to use (compare cassette deck to floppy drive to hard drive!).
2) Most of us are notoriously short on foresight, like I was when I thought that 64K and a floppy drive was the epitomy of computing (after all, I can do everything you can, right? I can process words, play games, etc.?).

While you may not see the use of multitasking, I bet you're as foresighted now as I was 10 years ago when I thought that 16K of RAM was big-time for a microcomputer.

Subject: How advertising helps already-owners
To: info-atari16@score.stanford.edu

Michael Vederman (uace0@uhnix2.UUCP) asks:

> Okay, how can you change Atari's image? Does it matter? Sure,
> more advertisements would be nice, but what benefit do we, the curreniet
> owners of STs derive from that?

The rationale goes as follows:
```

If the advertising is effective, more ST's will be sold, and the installed base will get bigger. This will attract more third party software vendors, who will write more software for the system, which means a better and wider availability of software for those who already owned the machine when the advertising began.

Clear?

I suggest that if you want to learn programming you take a class at a community college or through some other program where they provide the computer. The reason being that the things that make a computer easy to program, and the programs that make a computer useful may be a disjoint set. Have you ever programmed on a ZX81? Not much fun. Or maybe you buy a commodore 64 to learn programming, and then find out that you really want to program in C and no one makes a C compiler for

it. Maybe COBOL is your idea of fun, that wipes out the Atari and Amiga
right there. But the biggest danger is that you may discover you can't
program, or hate to program and now you have this essentially worthless
computer (remember the condition was that you bought it to learn programming).
I know a lot of people who have bought computers, the ones that took a
programming class were a lot happier. You learn a lot about computers
when you take a programming class. It gives you an edge, I heard about
a guy that bought a computer to program on that had only a line oriented
editor because the salesman had convinced him that editors that supported
editing on a "hard copy" terminal were more powerful than screen editors.

> I don't think BBN cares what I think about this stuff.
> And that's probably just as well.

I can see your rational to a point, though I believe that your over
looking one main point.

Atari is looking to get away from the GAME MACHINE image. I think
that this is an excellent idea. BUT,Right now, I hear more people talking to
other's to look at the machine and they refuse to look past the Game Machine
Image that is still attached to the name.

Increasing the user base is a great idea, but remember that most that
do check out the system, are pretty new to computer's for the most part.They
really don't know whats out there for third party software, and when they
do, they see alot of games made for the machine. They also see alot of
owner's talking about the neat games that they have, but when it comes to

what application software is available, well thats where were short. Sure games are fun, and show off the power of the machine, but all this power has to be put to better use!

What I am getting at is third party software parties like Word Perfect Corp., Monogram, and other's to get their software over to the ST and do it right! I'm not really all that choked up about the third party software houses that simply port their stuff over, and it runs like it would on a PC. I would like to see software that really flys, and takes full advantage of the machine. To date their are but a handfull of such programs and for the most part these companies have not seen fit to back up their product with the supprt that is really needed. Word Perfect has been the real exception.

Lets face it. Atari owner's *know what the machine is capable of, and with this knowledge, the demand the software to work correctly, and if it does not, the CO. should make a revision. This is not the case for the most part. Sure there are alot of packages out there that do perform quite well, but still don't make full use of the power that is available. Two markets that suffer quite a bit are the Business and Educational areas. These have been been improving, but were a long way off to where we should be, and where Atari would like it to be (my opinion of course).

I for one, like the idea of Atari buying Federated, and the work being done with the Abaq box. Excellent ways to increase performence, but it still has to be sold to the general public. Business in particular.

Ways for getting the point across.

I would start getting more software out that would 'DO THE JOB' and have my name placed on it (Atari name). Of course the software would have to work to perfection as advertised. Who else better than Atari to make a software product that does the job? They designed the machine, and know it better than anyone else. The software that they have produced, has been outstanding, and proves that fact. (Lets not get into Atari Basic though!) along with the machine, offer software that would help intice the MS-DOS brainwashed people to see the Atari as a viable alternative.

Case in point.

We bought DAK easy accounting from DAK for our business. The program was written in basic, then compiled. Thats not the real problem. The program was really un-supported. The bugs were not fixed, and when the CO. had to face the fact, they come up with deciding not to support the product, and then comming out with version two, state that there is no market for business software for the machine, thus not making the version two available for the ST. Then you get the software emulator, and version two, and the program runs so slow, that for all intence and purposes, is really not usable. Especially when you seen version one (buggy as it is) run as fast as it did, would make anyone cry. If Atari produced this product, the purchaser's would know that the product would be supported, and any bugs (if any) would be corrected.

I stand in the wings that Atari should produce some productivity
software for the machine. What they have produced is great, but what is
really missing is the business and educational software to act as a magnet
to draw more to the power of this fabulous machine.

Subject: big arrays in MW C
To: info-atari16@score.stanford.edu

Hi,
Does anyone know if MWC will safely handle large arrays now? I know
that I had problems in the early versions with HDSCAN's arrays in that
I had to keep the total amount of data in a particular array less than
32K bytes. Now when I compile tests (i.e. a char[10000][12]), I get a
message like:
strict: size of array overflows size_t
which doesn't make sense, since size_t is a long if I remember correctly.
Somewhat confusing (and frustrating now that my manual is out of phase with
the newer version of the compiler that I got recently.)

What I really want to do is fold my Unix version of HDSCAN back into the
ST version, and preferably with MW C. If it looks like it will be too much
of a mess, I will probably wait for the new version of Megamax, since that
sounds somewhat promising as well. (Yes, the Unix version is done...I
am mailing the source code to comp.sources.misc next week. Supports both
BSD and SYSV flavors of Unix).

-Thanks,

One point that has been a bit overlooked by the Desk Accessory/Pop-Up Utility
crowd -- why be forced to "make do" with the limitations that a Desk Accessory
imposes? NOT to suggest that the Desk Accessory are not useful, or that the
programming done by their authors is somehow lacking; what I DO mean is that
in a multi-tasking environment I have my CHOICE of any number of full featured
programs, all of which run together (within the limits of my systems
resources, of course.) So I can use the same word processor and outline
processor and spreadsheet and etc. that I always use, rather than one that can
run as a Desk Accessory (and thus is used mainly for just that reason.)

Subject: Re: A different view on multitasking.
To: info-atari16@score.stanford.edu

When I started working as an advisor at UofT, TSO was the main system besides
batch card jobs through JCL. Back then if you mentioned a Micro, you were laued
at and told they could never do what a BIG machine could do. Too bad I have
to use unix on a this SUN toy now instead of a 370 !!
Whats this have to do with multi-tasking? I'm not sure but the whole argument
seems kinda stupid. Buy what you want. I have an atari for games and an IBM
for programming and cad work. It would be really nice to have a multitasking
Sun 3 but I can get by on less. If multitasking would force(?) programmers
to produce better code then I'm all for it !

Agreed...even my worst case program (hdscan) takes less than a minute
to compile, so I rarely even have the urge to pop it into the
background...

> ... And yes, I know that background print spooler gadgets can
>run on single task DOS's ... I've seen 'em in CP/M, RT-11, Mess-DOS,
>and many many others. But I've never been convinced that they
>ever ran cleanly.

???Why not??? I have less trouble with the automatic print spoolers on
my PC clone and ST than I do on the Unix boxes at work. I can
prioritize jobs, edit stuff in the queue, etc on the ST version, but
those hacks are mostly fluff and rarely used...besides, I have seen
those handy little standalone print spoolers going for under $50
nowadays, so that may be a better solution in the long run...

>I'm thinking ahead some time into the future when we'll have
>ISDN running everywhere ... In order to handle network communications
>cleanly we'll need to have multi-tasking.

Umm, by the time we have ISDN running everywhere, our current computers will probably be dust. By then, most of us will probably be running some variant of Unix on our machines if we want to properly utilize ISDN (i.e. we will have BIG drives, some form of USENET access ..which I can't quite picture even two years from now, since we are running about 28MBytes of messages/week now..., very high speed modems, etc.)

>[There are] also things like mail daemons
>and such that recieve e-mail while you're asleep (or away
>or whatever).

UUPC seems to work fine on the ST and I have several STadel (ST citadel) boards that poll my Unix box every couple of hours for uucp mail and the comp.sys.atari.st sections. I am sure there are a lot of Amiga systems doing the same (I recall that UUPC came out for the Amiga and Citadel is also running on the Amiga).

>For right now? Well, how about killing run-away processes?

On the ST OS-9 or the Multi-tasking C shell has the standard ability to do this...And on the Amiga or the ST, you can always hit reset to kill everything, but still keep the things that were out on RAM drives...(I used this feature a lot on both the Amiga and the ST in the early days of using C compilers that were released too soon.)

I agree somewhat with Dave Meile on this discussion/argument. In the long run, the average user of a popular computer is not the 'BBS'-type or a person that needs anything more than a few utilities in the form of desk accessories on top of an application. Unfortunately, the IBM PC and the Mac have gained the 'average' user market, to date. Those of us with Amiga's and Atari ST's are either technical enough to appreciate and use the special features of the respective computer, or we had very, very persuasive friends who convinced us that the Amiga/ST was the best computer. The 'average' user is still the person that just buys a Mac or PC for a very specific purpose (usually for writing memos or doing spreadsheets in a business environment). They may run Lightning/Thunder (real time spelling checkers on the PC/ST) in a pseudo background manner, and have a ton of desk accessories or pop up tools, but they rarely go in for the increased complexity that a multi-tasking environment like DesqView offers on the PC. Even the carrousel approach (there, I just multi-tasked and asked my wife for a spelling check...it can also be spelled carousel) is somewhat confusing to people, but I have seen secretaries fall in love with the carrousel programs on the Mac and the ST...although not on the PC version for some reason.

>computer. Please email if you know of such a beast. Thx.

There is a very nice PD one for the ST...If I remember right, the docs
for it seemed to indicate that the original 'port' source would work
on any 68000 computer (it has been over a year since I played with
it, so the name of the company that wrote it escapes me). Atari did
put this out as a PD disk, so maybe Neil can help? If not, I'm sure
you could get the disk from your local Atari club...

I recall getting about 1.5MHz to 3Mz throughput on most of the
programs I had from the ATR8000 days...things like Perfect Writer,
Wordstar, Turbo Pascal, etc all worked fine. I even used some of my
wifes software that I copied over from her Geneva portable and it
ran fine (but emulating a 80 char by 8 line display).

I'm glad to see that someone else has discovered this gem of a machine. Around
this neck of the woods (New York) it seems to be selling well and users marvel
at the power, quality and accessories of a printer that sells for a relatively
meager $350 to $400. I've used several drivers and wound up with a variety of
screen dump sizes but all high quality. Speaking of high quality, if you're
into Desktop Publishing this machine will make you think twice about spending
all that money on a laser printer.

I've been using that package for a year, and the only bug I've
encountered was in the clock setting software, which would cause the
clock to freak in February.. it was quite amusing actually, and it
was fixed immediately (Chris would actually tell you the location to
patch in the executable if you didnt want to wait for him to send you
a new disk). No other bugs as far as I know,

Subject: Re: Hard disk boot???
To: info-atari16@score.stanford.edu

The problem you have with holding down the alt-ctrl-shift may have to do with
WHEN you hold down the keys. If you bootup with! the keys down, then it will
not work with the new ROMs.
Try turning on the machine (or resetting) wait a second, then hold down the
keys. This should work.
Don't use GEMBOOT with th[e new ROMs, use foldrxxx.prg instead.

Also, I had the same[problem with the message about a non-supported ROM
version. Ignore the message, the driver is actually installed, and works
just fine.

Subject: Re: Atari's Marketing Approach
To: info-atari16@score.stanford.edu

Okay, how can you change Atari's image? Does it matter? Sure, more advertise-
ments would be nice, but what benefit do we, the curreniet owners of STs derive
from that? Perhaps it would be a boost to our own egos having more commmercials
on TV. I mean who wants to own a machine that doesn't receive alot of press?
In actuality, I doubt that more TV advertising would do too much good, other
than allowing us to say "I saw the ad five times in one hour," or "Did you
see the ads last night?"

Ask yourself this - how many other computer companies make game machines?
Answer - NONE!
Not Apple, not IBM, not Commodore, no one.
Therefore, Atari is stuck, because they do currently sell game machines.

This is not neccessarily bad, but more advertising, I beleive will only give
us current owners a shot in the arm. Remembere, actions speak louder than
words, and no advertising can boost sales if you don't have an exciting line
of products to sell, and new products on the way. If Atari can produce, then
they zwill be successful. The ABAQ is exciting, but may come out too late to
'steal' the show. Is it important for Atari to come out with products first?
For us owners, we certainly would take a lot of pride in the company if we
were owners of a$ computer from a company that was 'on the leading edge' and
delivered prroducts before anyone else, but what real benefit do we get from
that other than feeding our egos.
So, before you go complaing to Neil, ask who will really benefit. Is this
'commercial wars.' Are we feeling left out? We have a good machine that is
exactl[y what we paid for. What more do you want?

Flame me at this address, if you want. I just get tired of complaining about
immaterial things. If you wanna complain, complain about how GEM is a closed
operating system that must be hacked at to figure out (that's GEM, not TOS).

My opinions are my own, and do not neccessarily reflect our users' group,
company, university, or any living being.

Subject: spectrum 512, MWC, BDT MT C-shell, Alpaha Mega Disk(?)
To: info-atari16@score.stanford.edu

I only had my 1040ST for a week before the drive went and I'm still waiting for it to come back so in the meantime I thought I'd ask a few questions.

I've been reading about Spectrum 512 in Antics START magazine and was wondering if anyone has disassembled the code and found out how they put 48 colors per scan line? Does this code work for putting more colors per scan line in medium rez? Also could anyone out there who owns Spectrum 512 tell me how like/dislike this product?

I plan on buying it just for the feature of 512 colors but I was just wondering how good a paint program this is compared to Degas & NeoChrome.

About how they do it, Spectrum owns the rights to Spectrum 512 not the ability to put 48 colors per scan line. I feel Spectrum has done something that I didn't think was possible and they deserve all the customers they can get, it's just that I hope the how's and why's of the scan line trick become public knowledge, for a person shouldn't have to buy the program just to be able to have 48 colors per scan line on their ST's.

I'm currently using Mark Williams C with Beckemeyers MT C-shell and together they make a pretty powerful programming environment. I was wondering if anyone knows how much temp space both programs use? I set a ramdisk up and put the most used commands from MT C-shell into it (ls, cd etc.) and was wondering how much bigger I should make the ramdisk to hold the /tmp area which MWC & BDT MT C-shell use for temporary storage.

Also while talking about ramdisks has anyone bought the Mega disk(?) by Alpha. It's suppose to be a 1 meg. ram cartridge which plugs into the cartrige port on the Atari and gives you the ability to have an 800k ramdisk + 200k printer spooler or two 400k ramdisks and the printer spooler. Also included for $299 is a power supply so that after you turn your computer off your data is still intact, sort of like a mini Hard Drive. For the price it sounds good, if anyone has bought one could you tell me how you like it and also how could I get MT C-shell to recognize the 200k printer spooler?

Thanks in advance

Merry Christmas & Happy Holidays to all

Subject: Text -> Speech Programs
To: info-atari16@score.stanford.edu

I am making this inquiry on behalf of a partially sighted person
who has recently purchased an Atari ST.

What he is looking for is a Text -> Speech conversion program that
would allow him to hear the contents of a text file. I know that there
is a simple speech program available called ST-TALK that performs this
function, but only on text typed from the keyboard.

Does anybody know of a similar program that could read a file of text
and then speak it back? Are there sources available for the aforementioned
ST-TALK that might be modified to make it work on text files?

Please reply to me by mail, unless, of course, you think it is important
enough to post.

Michael Vederman (uace0@uhnix2.UUCP) asks:

> Okay, how can you change Atari's image? Does it matter? Sure,
> more advertisements would be nice, but what benefit do we, the curreniet
> owners of STs derive from that?

The rationale goes as follows:

If the advertising is effective, more ST's will be sold, and the installed base will get bigger. This will attract more third party software vendors, who will write more software for the system, which means a better and wider availability of software for those who already owned the machine when the advertising began.

Clear?

:>anything about which computer to buy? Very little, probably.

I suggest that if you want to learn programming you take a class at a
community college or through some other program where they provide the
computer. The reason being that the things that make a computer easy
to program, and the programs that make a computer useful may be a
disjoint set. Have you ever programmed on a ZX81? Not much fun. Or
maybe you buy a commodore 64 to learn programming, and then find out
that you really want to program in C and no one makes a C compiler for
it. Maybe COBOL is your idea of fun, that wipes out the Atari and Amiga
right there. But the biggest danger is that you may discover you can't
program, or hate to program and now you have this essentially worthless
computer (remember the condition was that you bought it to learn programming).
I know a lot of people who have bought computers, the ones that took a

programming class were a lot happier. You learn a lot about computers
when you take a programming class. It gives you an edge, I heard about
a guy that bought a computer to program on that had only a line oriented
editor because the salesman had convinced him that editors that supported
editing on a "hard copy" terminal were more powerful than screen editors.

> I don't think BBN cares what I think about this stuff.
> And that's probably just as well.

I can see your rational to a point, though I believe that your over
looking one main point.

Atari is looking to get away from the GAME MACHINE image. I think
that this is an excellent idea. BUT,Right now, I hear more people talking to
other's to look at the machine and they refuse to look past the Game Machine
Image that is still attached to the name.

Increasing the user base is a great idea, but remember that most that
do check out the system, are pretty new to computer's for the most part.They
really don't know whats out there for third party software, and when they
do, they see alot of games made for the machine. They also see alot of
owner's talking about the neat games that they have, but when it comes to
what application software is available, well thats where were short. Sure
games are fun, and show off the power of the machine, but all this power has to
be put to better use!

What I am getting at is third party software parties like
Word Perfect Corp., Monogram, and other's to get their software over to the

ST and do it right! I'm not really all that choked up about the third party software houses that simply port their stuff over, and it runs like it would on a PC. I would like to see software that really flys, and takes full advantage of the machine. To date their are but a handfull of such programs and for the most part these companies have not seen fit to back up their product with the supprt that is really needed. Word Perfect has been the real exception.

Lets face it. Atari owner's *know what the machine is capable of, and with this knowledge, the demand the software to work correctly, and if it does not, the CO. should make a revision. This is not the case for the most part. Sure there are alot of packages out there that do perform quite well, but still don't make full use of the power that is available. Two markets that suffer quite a bit are the Business and Educational areas. These have been been improving, but were a long way off to where we should be, and where Atari would like it to be (my opinion of course).

I for one, like the idea of Atari buying Federated, and the work being done with the Abaq box. Excellent ways to increase performence, but it still has to be sold to the general public. Business in particular.

Ways for getting the point across.

I would start getting more software out that would 'DO THE JOB' and have my name placed on it (Atari name). Of course the software would have to work to perfection as advertised. Who else better than Atari to make a software product that does the job? They designed the machine, and know it better than anyone else. The software that they have produced, has been outstanding, and proves that fact. (Lets not get into Atari Basic though!) along with the machine, offer software that would help intice the MS-DOS brainwashed people to see the Atari as a viable alternative.

Case in point.

We bought DAK easy accounting from DAK for our business. The program was written in basic, then compiled. Thats not the real problem. The program was really un-supported. The bugs were not fixed, and when the CO. had to face the fact, they come up with deciding not to support the product, and then comming out with version two, state that there is no market for business software for the machine, thus not making the version two available for the ST. Then you get the software emulator, and version two, and the program runs so slow, that for all intence and purposes, is really not usable. Especially when you seen version one (buggy as it is) run as fast as it did, would make anyone cry. If Atari produced this product, the purchaser's would know that the product would be supported, and any bugs (if any) would be corrected.

I stand in the wings that Atari should produce some productivity software for the machine. What they have produced is great, but what is really missing is the business and educational software to act as a magnet to draw more to the power of this fabulous machine.

Subject: big arrays in MW C

To: info-atari16@score.stanford.edu

Hi,
Does anyone know if MWC will safely handle large arrays now? I know
that I had problems in the early versions with HDSCAN's arrays in that
I had to keep the total amount of data in a particular array less than
32K bytes. Now when I compile tests (i.e. a char[10000][12]), I get a
message like:
strict: size of array overflows size_t
which doesn't make sense, since size_t is a long if I remember correctly.
Somewhat confusing (and frustrating now that my manual is out of phase with
the newer version of the compiler that I got recently.)

What I really want to do is fold my Unix version of HDSCAN back into the
ST version, and preferably with MW C. If it looks like it will be too much
of a mess, I will probably wait for the new version of Megamax, since that
sounds somewhat promising as well. (Yes, the Unix version is done...I
am mailing the source code to comp.sources.misc next week. Supports both
BSD and SYSV flavors of Unix).

-Thanks,
Todd Burkey

Subject: eproms burners
To: info-atari16@score.stanford.edu

hi

I hate to interupt this fasinating discussion on multi-tasking but
I need to find an eprom burner to use with the ST. I thought hippo
made one but I can't find any information. Does anyone have or used one
with the ST, any comments.

thanks
jim, on a friends account

Subject: Re: Multi-tasking? A nightmare...
To: info-atari16@score.stanford.edu

I still have not heard one counter argument against the value
that multi-tasking has as a tool for the programmer to use to
write better programs. Perhaps the user does not see this as
multi-tasking, but benfits from it none the less. After all,
this is a powerful tool and we programmers can use it to make
what would otherwise be a difficult task an easy one. This
this translates to less expensive or more feature full programs.

I have never said that multi-tasking was "essential". However,
it is a VERY powerfull and usefull tool for both the software
developer and the user alike. And you need not use it if it is
too much for you.

As far as this OS/9 buisness goes, if it were being distributed
free then it might mean something, but from what's been said it
will be held by only a small fraction of the ST users due to its
price. Thus programmers will not be able to consider the bulk of
the ST market when depending on OS/9, and will not be likely to
do so. So much easier when its included with the basic system!

Thanks, Happy New Year,

Wade.

> as much power as you're ever liable to need in most environments.

Let's face it, even a Timex Sinclair with 16K of RAM can do all of the above (just a bit slow and limited). A boat-anchor CP/M system can also do all of the above, and would be cheaper (nowadays) besides. But I sure the hell don't like to use one after I've used BSD4.2 & other OS's that take advantage of multitasking.

For example, take the term paper. I'm using an 8-bit single-tasking system right now. I set it to printing. Then I go away for 20 minutes while my NX-10 bangs away in near letter quality mode (more "near" than "letter", but that's the breaks!). That irritates me. Greatly. There's a couple of things I could do here: Use my RAM-disk and jam a software interrupt-driven spooler on my LST: device (multitasking!), go out and buy a 512K print spooler (multitasking again, although in this case with a dedicated processor), or any other number of things. All of which are multitasking. All of which are a kludge, and would be unnecessary if real multitasking was available.

I remember my first computer. 5K of RAM, 16K of ROM, I was in hawg heaven, a computer all my own, to hack in 6502 assembly language on. I lusted for 16K, because with 16K, you can do anything, right? 64K? forget it, 64K was for rich folks with $2,000 to buy the latest CP/M boat-anchor (so-called because of its size and weight, in this case :-). Disk drives? Why would anybody want disk drives? I can load and save just fine with my cassette recorder!

Then I moved up to a 64K machine with a disk drive. Wow. Big time now. I'll never take that 5K machine out of the closet again (even tho I expanded it to 16K). After all, it's just an obsolete toy now, right? and 64K... I can do ANYTHING! Wow, what power. Why would I want one of them fancy dandy 68000 machines, 'specially when they all cost $5,000 for 256K of RAM, and I can do everything they can, on my li'l min-anchor? I mean, I can process words, I can write programs, I can play games... they do all that, right?

There's 2 points I wish to make:
1) Some features added to the computer make it more productive and easier to use (compare cassette deck to floppy drive to hard drive!).
2) Most of us are notoriously short on foresight, like I was when I thought that 64K and a floppy drive was the epitomy of computing (after all, I can do everything you can, right? I can process words, play games, etc.?).

While you may not see the use of multitasking, I bet you're as foresighted now as I was 10 years ago when I thought that 16K of RAM was big-time for a microcomputer.

1029. Out board graphic processer

Newsgroup: comp.sys.atari.st
Date: 1988-01-06 23:38:11 UTC
From: 870646c@aucs.UUCP
Message-ID: <694@aucs.UUCP>
Source record: 255229

Hi all, I was just reading a new mag. from Germany, there seems to be an out board graphics processor that you can get for the ST. It plugs in through the cart. port. You need to buy a monitor for it(to support the rez.) The art prg. runs on the ST monitor, and the results are displayed on the other monitor. As far as I could see the rez. is 1024X800(or so). The price was a couple of thousand, but it would be a great thing for a graphic work station. They stated in the review that the out board cpu can be accessed by any high level lang(?). Also say an add for a 68881 board, from what I could see it plugs in under the MMU(?). The cost of the 68881 board was about $650 CDN.(not bad). Also GFA has a version of their Basic out that will support the chip(special order). If anyone has anymore info on these products why not pass it on.

>
> After discussing this with Chris at BMS I learned the following:
> 3. SH204 CANNOT report ANY ERROR to the computer.

That's just not true. I don't know why he thought so. CRC errors, seek errors, sector-not-found errors all can be presented to the CPU as error conditions after a seek, read, or write operation.

> BTW, hdx CANNOT mark as bad the blocks in the root directory or the SAMS.

I assume you mean FATs, not SAMS... I don't know where your terminology comes from. But it's not HDX's fault, and certainly not the controller's. That's the fault of MS-DOS, of which GEMDOS is an approximate clone. We never claimed we could do bad-block forwarding, and there's no other way to mark blocks which are bad in the part of the disk that holds the bad-block information.

It *is* HDX's fault that it doesn't record bad blocks very well. For instance, it doesn't remember bad blocks when you repartition or reformat the disk. We at Atari are building new hard disk tools which will record bad blocks better, and keep track of them across repartitioning and reformatting. Furthermore, it will refuse to put a partition header (the boot sector, FATs, and root directory) in a place with a bad block. HDX should have done this, but didn't.

So are you implying that if Multitasking were free to all users, it
would be used? Say if a multi-tasking TOS compatible kernel were
available free to all users of the ST. In other works a free
runtime-only kernel to anybody that asks. Maybe even Atari gives
it aways with each machine. Programs developed for the multitasking
kernel will run on any machine with the free kernel installed.

End-users get the runtime kernel free. Developers pay for a "development
kit" that includes non-PD documentation and programming language interfaces.

How many people would be interested in such a thing? At what price
for the developers kit?

If I get enough replies, I might consider making the run-time RTX
program FREE.

1035. Some Questions

Newsgroup: comp.sys.atari.st
Date: 1988-01-07 10:23:25 UTC
From: t68@nikhefh.hep.nl
Message-ID: <416@nikhefh.hep.nl>
Source record: 255235

Can anybody answer any of the following questions?

What are the exact conditions under which Mediach returns the code
'maybe changed'. Can this happen when a floppy is not on write protect?

What speed should EPROMs have to replace the ROMs in a 1040 without me
having to worry about the pull-up resistors in the address lines (they
help wrt the crashes during booting)?
Is this the same for the Mega's (I know already how to change jumpers
to flip from the Megabit ROMs to 256K EPROMs)?

The above is needed for making some private modifications to the ROMs.

Thanks,

Jos Vermaseren,
t68@nikhefh.uucp

Source record: 255237
Cross-posted to: comp.sys.atari.st,comp.sys.amiga

Well, that provoked a lot more response than I'd thought it might when I made the original posting. I also got a fair bit of email about it. (I tried to reply to each individually, but a lot of the replies bounced -- if you didn't get yours, thanks for your response anyway. I told the people I got mail from that I would post a summary -- so here goes.)

The mail I received (which didn't degenerate into a flame war) seemed to be divided about 50-50 for/against my ORIGINAL proposition. Please NOTE (since it seems to have gotten lost in the discussion) that I didn't say that multi-tasking wasn't NICE or USEFUL -- I said (or at least, thought I said) that I didn't think it could be considered to be the be-all and end-all -- and that for my purposes at least, simpler interrupt handlers were totally sufficient. (And, that on a small, e.g. 500K, machine, I couldn't think of many combinations of things that I use which could co-exist in the memory space.)

A few particular points which kept cropping up --

Simultaneity is handy and makes writing particular sorts of programs easier. -- OK, I'll grant that. However, a couple of the examples commonly used were mis-chosen, I think. To pick the most common two -- simultaneous compilation and editing: well, I've been converted to 'make' (I know, I said about a year ago that I couldn't see a use for it on a non-hard-disk system) and I tend to have one major project at a time (at home -- unlike work). Don't like the idea of 'make' using files that I am busy editing simultaneously. Concurrent compilation and debugging -- Hmm. Not me. Not until I can get a home micro with protected memory partitions for each application, and with interprocess communication restricted to well-defined, thru-the-OS, gateways. Don't want my half-debugged program running silently amok and deciding to use as workspace the bit of memory where the compiler is constructing my new object segment. Paranoid? Yes -- more so every year. The only thing I want co-resident with a program I'm debugging is the debugger, thanks very much. However, for well-behaved proggies, and given enough memory space to use them sensibly, I can't argue with this one at all.

Interrupt handlers and resident accessories are poor seconds to true multi-tasking. -- Sorry, don't buy that. They perform totally different functions, I think. A proper resident accessory is used (MY OPINION) to break out of a task which requires your full attention, to perform some mini-task which requires attention, prior to going back to it. An interrupt handler is a well-proven, easy to write reliably, way of doing I/O and other things which naturally ask for attention when they need it. I'll grant that if you need more than that, you may need multi-tasking; but if you don't, you don't. As for simultaneous print and plot spooling -- well, doesn't bear thinking

about, until one or the other of the machines come up with a version with two parallel ports rather than the one -- or until the Async Transport Service protocol catches on.

Just because a 'non-power' (whatever that is) user doesn't need it now, doesn't mean he'll NEVER need it. True. But NEVER is a long time in this context. By the time he does need it (in another year or two) all these, our beloved machines, will be painfully obsolete anyway, and we'll be looking at 4 Gigabyte machines, with 68080 chips (don't look in the parts list, I made that up) with builtin math processors, segmented, demand-paged memory with full protection between competing processes. (Actually, the 020 (or do I mean the 030) is getting pretty close already.)

(Or maybe, if Acorn can get their pricing into realistic levels, we'll all be wiped out by the Archimedes and similar RISC-technology machines.)

Anyhow, I achieved my goals, which were (a) to gain a feeling for how much M/T is used, and (b, I hope) to stir up some thinking. I'd just as soon see this chain stop now -- but if it doesn't, at least keep in mind that the premise is *not* that M/T isn't useful (he says, typing this in while the mainframe gets on with half dozen compilations for him) but that IT IS ONLY ONE CRITERION TO BE KEPT IN MIND AMONG ALL THE OTHERS. IT IS *NOT* THE ONLY GAME IN TOWN.

(Sorry for shouting. Happy New Year to the happy owners of both machines.)

:-)

(Since I think we've talked it to death, replies by mail to me if you can work out a 'reply' address in the midst of all the current gateway changes. If any *new* insights appear, I'll summarize, otherwise I'll abandon.)

1038. Re: Resource file question

I posted this before Xmas, but in the face of comms outages,
and ambiguous messages from our mailer, I'm not sure the original got through.
It's short enough it feels more efficient to re-post rather than to ask. If
two copies arrived, sorry -- but save the net some traffic and don't bother
to tell me. Happy New Year.

In article <1607@wiley.UUCP> bob@wiley.UUCP (Bob Amstadt) writes:
>The Kuma Resource Editor is now unavailable. The product has been
>discontinued.
>--

This surprised me, because I know (a) that it is still in the shops in the UK;
and (b) it is listed in Kuma's very latest (Dec 87) product/price list.
Since I was writing to Kuma anyway (to get myself de-duped from their mailing
list -- one copy is enough) I asked about this. The reply (from Jon Day,
their Marketing Director) says:

Regarding K-Resource in the USA, all our products are available and
distributed in America by C.S.S of Addison, Illinois, they can be
contacted on 312-620-4444. K-Resource was also distributed by Antic,
however they seem to be concentrating primarily on entertainment
titles now, whilst being unhelpful regarding other products. We are
workiing to further strengthen our distribution in the USA next year.

So, K-Resource *IS* still supposed to be available on the West of the pond.
But apparently not from Antic. Suggest you try (or have your dealer try)
this C.S.S. lot. Not worth a transAtlantic phone call to me to find out...

Failing that, Kuma themselves are Kuma Computers Ltd., 12 Horseshoe Park,
Pangbourne, Berkshire RG8 7JW, England (International phone 44-7357-4335),
though I confess I'd be reluctant to try international mail order myself.

(As usual, I have no connections with any of the companies named above,
except as an occasional purchaser of their products for my own use.)

Happy holidays.

1041. Does this mean we'll have to be nice to each other?

Newsgroup: comp.sys.atari.st
Date: 1988-01-07 15:13:11 UTC
From: pes@ux63.bath.ac.uk
Message-ID: <2063@bath63.ux63.bath.ac.uk>
Source record: 255241
Cross-posted to: comp.sys.atari.st,comp.sys.amiga

According to a blurb in the computer section of today's Gruaniad newspaper, Argonaut say they will be producing Starglider II to be 'disk-level compatible' between the Atari ST and the Commodore Amiga. That is, you take the disk, stuff it into whichever of the two machines you prefer, and fire it up. It loads, has a look around, works out which of the two machine types it has been turned loose onto, and does the right thing. They say they hope to interest other software manufacturers in the idea. (And why not? Must offer an incredible savings to the manufacturers and to the retailers, if they can cater for two machine ranges with one box.)

The writer goes on to hypothesize that the next obvious step is an object-compatible third-party operating system for both machines. I shall have to stare at my navel for a bit, and wonder whether it could be sensibly done in a manner which would let you get at the stronger points of whichever machine you are on, rather than at a lowest common denominator level -- which I don't think would be doing anyone any favours. Right off, without thinking much about it, I wonder whether we could actually learn to talk together reasonably enough for it to take off. :-)

(Note, the smiley applies only to the sentence which it immediately follows. The rest of this posting is serious.)

Happy New Year...

WRONG! There are other things about the Amiga besides multi-tasking that make it worth buying: outstanding color graphics (specifically, HAM mode), the versatility made possible by the "copper" co-processor (I feel that we are currently only scratching the surface), outstanding sound, reasonable price, easy interface to current video technology (making things like "desktop video" possible). I'd like to see Marble Madness! running on an Atari ST, or a Macintosh, or an IBM. I don't think it would look nearly as impressive as it dones on the Amiga---with the exception of the Mac II (which is prohibitively priced anyway). The same comment goes for Arkanoid.

The Amiga is not just a game-playing machine. But the games serve as a good example of the machine's capability and potential.

> ...

What is the "serial number" you mention?
I have seen no mention of it before.
I have noticed something called "disk label" that comes up
when I ask it to "SHOW INFO". Is *that* the "serial number"?

How can I be sure that no two disks have the same serial number?

Ah yes, but I'm cute and have great legs.

> Would Dave
>Meile and others in comp.sys.arari.st please accept an apology from
>us amiga folks?

Don't apologize for me you nimrod. I have nothing against ST's or their
owners. But Atari people who blather in comp.sys.amiga about how
the amiga's features are "not needed" are fair game.

If you want to flame amiga's, fine. Do it in comp.sys.not.amiga. Do it
in alt.flame. But do it in this group, and you just may get a rebuttel.
Do it four times and people may get testy.

So, let me see... If there is a disk in the drive at power-on, the Supra
boots *immediately*. If I have the three keys down (diskette in drive),
Supra still boots immedately. Seems like I have to: turn machine on. Wait
about one second. Push the three keys. (Maybe wait for ST to go after the
floppy drive again) Push diskette into drive while holding the keys down.
What a pain! I don't think it'll work, either.

I'm going to call Supra today and ask them if they have a boot program
that is a little less zealous ;-)

> I'm going to call Supra today and ask them if they have a boot program
> that is a little less zealous ;-)

I just got off the phone with a tech-support guy at Supra. He tells me that
the scenario described above is exactly what I have to do; they cannot
program around it.

They say that the problem is in the "blitter" ROMs. The keycode that is
made by ctrl-shift-alt isn't available to the Supra boot program as soon as

that program would really like it to be. The boot program cannot detect
the key combo until much later in the boot, at which time the program is
just about to boot from the fixed disk anyway.

>32K bytes. Now when I compile tests (i.e. a char[10000][12]), I get a
>message like:
> strict: size of array overflows size_t
>
This message is just a warning -- it is because size_t is in fact an
unsigned int in MWC 2.1.7. size_t is the default type of the result
of the sizeof operator. MWC does support objects larger than 64K now,
and this warning is harmless unless you are passing sizeof(foo) to a
function that is expecting an int. Sizeof is promoted to a long when
it overflows the unsigned int. When MWC releases an ANSI conforming
(rather than K&R, which is what it conforms to now with some ANSI
extensions), size_t will become a long instead of an int, and then
this kind of warning will go away.

Even in version 2.0, external objects of > 32K were supported, they
just could not be declared. They could be allocated with lmalloc()
and then accessed as arrays using the pointer/array equivilance.

I hope all of this helps.

Speaking of being short on foresight, it was only today that I was modifying
my handy dandy disk re-organizer program (Devices are a pain!) and guess what?
I was trying to ^XF (save and finish up) out of Emacs and was out of disk space.
How many of you have ever told an editor you were finished, fallen short of disk
space, and lost everything because the editor was not taught social graces? I'm
sure I'm not the only one.
Solution? Use my MULTITASKING Amiga to clean out some disk space before I
clicked on the retry block of the requestor.
Result? I didn't kill my entire family due to the frustration of losing my
program.
Moral? Even though nearly anything can be simulated with proper programming on
a non M-T system, it rarely is. Many programmers take short cuts which
do not allow for mistakes. M-T'ing systems are like insurance in case
your favorite program has problems.

What about formatting a floppy while you are running your Word-Processor, and your floppy is full? What I like is the ability in Multi-tasking systems, is the ability to SUSPEND, and not just ABORT a program, when I need to interrupt.

It's pretty arrogant to say that because I can't think of any, that [insert any feature] is useless!

While your floppy disk configuration limits you, this still limits you in a single-task O.S. It is irrelevant to multi-tasking versus single-tasking! There are lots of tasks that even if you do a Terminate and Stay-Resident, will need you to swap disks, if you are out of room, etc. Batch files that have hard-coded drive designations will still be a problem if you have other floppys in place.

A couple of digests back someone posted HDB23. However, I've noticed from an old atarinet listing that there is a version 2.4. Does it really exist? If so could someone mail me a copy?

Also, does anyone have a copy of NMFPS. It is supposed to convert metafiles to postscript. It was also listed in atarinet a while back. A copy of this would also be very much appreciated.

Thanks. /bill

Subject: IBM Drives with ST
To: info-atari16@score.stanford.edu

lineaterlineaterlineaterlineater

Does anyone have the document file on how to hook up an IBM
style drive? I am attempting to do it here. I have a tandon TM100
full height drive. I ripped it out of an old PERCOM setup for the
old ataris. Has anyone done this? I see the tricks that atari is
doing with the drive select line but am not quite sure how to cope
with it.
Somebody help me before I fry my ST....

>drive. If it hasn't changed, then the disk hasn't changed, either.
>This is another assupmtion: you should not have two disks with the same
>serial number.
> ...

What is the "serial number" you mention?
I have seen no mention of it before.
I have noticed something called "disk label" that comes up
when I ask it to "SHOW INFO". Is *that* the "serial number"?

How can I be sure that no two disks have the same serial number?

Ah yes, but I'm cute and have great legs.

> Would Dave
>Meile and others in comp.sys.arari.st please accept an apology from
>us amiga folks?

Don't apologize for me you nimrod. I have nothing against ST's or their
owners. But Atari people who blather in comp.sys.amiga about how
the amiga's features are "not needed" are fair game.

If you want to flame amiga's, fine. Do it in comp.sys.not.amiga. Do it
in alt.flame. But do it in this group, and you just may get a rebuttel.
Do it four times and people may get testy.

So, let me see... If there is a disk in the drive at power-on, the Supra
boots *immediately*. If I have the three keys down (diskette in drive),
Supra still boots immedately. Seems like I have to: turn machine on. Wait
about one second. Push the three keys. (Maybe wait for ST to go after the
floppy drive again) Push diskette into drive while holding the keys down.
What a pain! I don't think it'll work, either.

I'm going to call Supra today and ask them if they have a boot program
that is a little less zealous ;-)

I just got off the phone with a tech-support guy at Supra. He tells me that
the scenario described above is exactly what I have to do; they cannot
program around it.

They say that the problem is in the "blitter" ROMs. The keycode that is
made by ctrl-shift-alt isn't available to the Supra boot program as soon as
that program would really like it to be. The boot program cannot detect
the key combo until much later in the boot, at which time the program is
just about to boot from the fixed disk anyway.

>32K bytes. Now when I compile tests (i.e. a char[10000][12]), I get a
>message like:
> strict: size of array overflows size_t
>
This message is just a warning -- it is because size_t is in fact an
unsigned int in MWC 2.1.7. size_t is the default type of the result
of the sizeof operator. MWC does support objects larger than 64K now,
and this warning is harmless unless you are passing sizeof(foo) to a
function that is expecting an int. Sizeof is promoted to a long when
it overflows the unsigned int. When MWC releases an ANSI conforming
(rather than K&R, which is what it conforms to now with some ANSI
extensions), size_t will become a long instead of an int, and then
this kind of warning will go away.

Even in version 2.0, external objects of > 32K were supported, they
just could not be declared. They could be allocated with lmalloc()
and then accessed as arrays using the pointer/array equivilance.

I hope all of this helps.

Speaking of being short on foresight, it was only today that I was modifying
my handy dandy disk re-organizer program (Devices are a pain!) and guess what?
I was trying to ^XF (save and finish up) out of Emacs and was out of disk space.
How many of you have ever told an editor you were finished, fallen short of disk
space, and lost everything because the editor was not taught social graces? I'm
sure I'm not the only one.
Solution? Use my MULTITASKING Amiga to clean out some disk space before I
clicked on the retry block of the requestor.
Result? I didn't kill my entire family due to the frustration of losing my
program.
Moral? Even though nearly anything can be simulated with proper programming on
a non M-T system, it rarely is. Many programmers take short cuts which
do not allow for mistakes. M-T'ing systems are like insurance in case
your favorite program has problems.

Frank,
If it is of any help, there is a large amount of TCP/IP interest in amateur radio circles. In particular ham-radio.packet has a lot of talk about TCP/IP. Versions exist (source available) for IBM PC, Amiga and Macintosh, as well as some UNIX systems, all related to amateur radio networking. I have been waiting for someone to announce that they have ported this to the ST but have not seen that yet.
I hope this gets to you OK, as I am new to the net and vi editors so I can't be sure what will happen!

This reminds me of a joke. . .

A guy goes to a doctor and says "Doc, it hurts when I do this" (he lifts
an arm up, or something)

So the doctor says, "well then, don't do that".

If running marble-madness slows up a compile too much, don't run
marble-madness.

The moral of the story is, don't ask us do be limited by others "limitations".
As opposed to IBM, and now even (Cr)Apple, who are now bending down to the
lowest common denominator, who don't want to burden the average user with
unnecessary complexity (the original closed-Mac architecture was a
manifestation of this philosophy).

> I may want to collaborate with.

I think Wade is right on target here. Multi-tasking does not have to be seen
by the user to be important. On the Amiga, you can't HELP but use multi-
tasking, because the operating system is using it all the time. Each disk
drive has a separate "Filing System" process running (use MonProc, you'll see

them), there is a separate input task running (I believe that Intuition really is an input handler, so technically, it runs as part of the input device task), each CLI window has a console task associated with it, the serial port has a separate task controlling it.

Why is this important? Because it makes it so much easier to do things. For example, early on in the Amiga's life, Matt Dillon (I think) distributed a set of asynchronous file routines. These are very useful, and almost trivial to implement under a multi-tasking OS (not to belittle Matt's work - it's quite good).

Or how about the Workbench? Contrary to many people's belief, the WB is NOT the operating system. It's just a program. A plain, old, ordinary program, with no special tricks or hooks. An ordinary mortal could write a program that does similar actions. Witness HackBench. I've often thought about writing a WB replacement myself.

If you want to talk about disk swapping, try switching between applications on a Macintosh. It has to load the Finder every time. Why do you think theres a "mini-finder" menu option? I keep trying to pull down the "screen" and use the finder which I expect to still be running back there.

I've written programs that monitor other programs (MonProc and MonIDCMP), and that run as input handlers (ClickUpFront, HeliosMouse, wKeys), and some stuff that I haven't released. These would be much more difficult without multi-tasking.

Code can be made much more modular with multi-tasking, and smaller, too. Unix people should love this, because you can make programs much more like filters, except you have both ends of the pipe running at the same time, passing data via a message port, or even a PIPE: device. Functions don't have to be duplicated from program to program. For instance, if I write a program that graphs a function, I will not have to add a save-to-IFF-file option, because I already have a program that lets me select a portion of a window or screen and save it as an IFF file. That's a normal program - no special desk-accessory hooks, no special requirements about what programs I can use it with, or what ones I HAVE to have running when I use it.

Don't get me wrong, desk-accessories are great (I'd never be able to use a Mac without them), but they are an attempt to achieve multi-taksing where it's not built into the system to start with. Admirable! Great stuff! Keep up the good work! But don't complain when someone offers you what you've been trying to achieve all along.

> THE POINT IS THIS: As a programmer I find the idea of writing
> such a program as being much simpler with multi-tasking facilities
> than without them.

Exactly! Right on!

> My question for you is, what do you have against multi-tasking?

I also wonder the same thing. Where's the beef?

> Take OUR (all of us who have given testomonials) word for it that
> the disk swapping "nightmare" is indeed just a bad dream.

As I mentioned before, I'd hate to have to load the Workbench in from disk every time I quit using a program! I'm much happier letting it run in the background until I need it again.

One last comment: (finally :-) the times I find multi-tasking the most helpful is when I WASN'T expecting to have to use it. If I'm using a word processor writing a paper, and need to check some results, I can just start up my statistical analysis program to get my answers (and I can keep on writing while it loads in of the floppy). I don't want to have to know ahead of time that I need to start up whatever carousel or special multi-tasking editor I need in order to do this. If I knew ahead of time, I'd have done the statistics before I started the word-processor!

Well, I've gone on far too long as it is. Thanks for listening.

re: bugs in bms package -

i've been running a bms-based hard disk system since last january. the only bugs i have ever encountered were software bugs. recall that the bms adapter board has a battery-backed clock. it seems that chris rhodin, the guy who runs bms and does the development, made a very small but important error in the clock-setting program (settime.prg, i think - the one that goes in your auto folder) which screwed up on february. actually it was kind of humorous. never affected hard disk use at all. he found the problem feb. 1 1987, and had updated software out in the mail to everyone shortly thereafter.

i'm mainly posting this to stop what could be a harmful rumor. i am a very satisfied customer of berkeley microsystems. their product is reasonably priced, in my opinion, and their telephone support is superb (of course, before they had any documentation, it had to be! :-)

the bms-100 adapter has evolved somewhat; it is supposedly laid out more attractively on the board, it is pretty well documented, the software has all been rewritten. it's a pretty mature product now.

if there were hardware bugs, i would be interested in hearing about them.
if not, please don't do bms any disservice by spreading such rumors.

one more note: i wrote an article for ST Applications magazine last spring
detailing the construction of a bms-based hard disk system for the ST.
it covers all the details of a single-HD system, and vaguely addresses
the double-HD system too (at that time i only had one HD). it appeared
in march 87, i think. at that time i offered to mail out copies, in
either electronic or paper form, to anyone who requested one. that
offer still stands. note that the electronic form omits the graphics
(done on my cad system at work, not on the st), so if you want the whole
thing you should buy the magazine or request the paper copy from me.
if you want electronic, mail me at the address below; if you want paper,
send me a self-addressed stamped envelope to the postal address below.

Subject: Using a 520ST for video tape titling
To: info-atari16@score.stanford.edu

Has anybody used their ST for creating video tape titles? If so, I'd like
to hear how you did it.
- What software did you use to create the title?
- Did you transfer the image directly via video connectors? Or did you
simply record the image displayed on the monitor using a camcorder?

Tony:

I tried several times to reach you via e-mail, but was unsuccessful (not
surprising since the path was 17 machines long). There is a programm
called STSPEECH that will speak a line typed in on the keyboard or speak
an already-created text file. Needless to say, it has a very strong
"synthesized speech" accent but it really quite understandable. It is a
public domain program. Send me e-mail if you want the details.

Subject: Re: IBM Drives with ST
To: info-atari16@score.stanford.edu

In article <568@unirot.UUCP> josh@unirot.UUCP (josh cohen) writes:
>
>lineaterlineaterlineaterlineater
>
>
> Does anyone have the document file on how to hook up an IBM
>style drive?

Josh;

Here is the connections that I made. Has been doen to the Tandons and others
without problems.

ST pin # IBM Style drive pin #

```
1 ---------------------- 30
2 ---------------------- 32
3 ---------------------- 3
4 ---------------------- 8
5 -- This is the drive select - hook to #2 (B) on IBM Style
6 -- Drive select also, but ignore this one
7 ---------------------- 3
8 ---------------------- 16
9 ---------------------- 18
10 ---------------------- 20
11 ---------------------- 22
12 ---------------------- 24
13 ---------------------- 26
14 ---------------------- 28
```

There is also a resistor that will have to be pulled up, to make
the drive work correctly. I Think it's R49 on most. It's value is in the
range of 100 to three hundred Ohm's. It's usually situated close to the
drive select block in the IBM Style drive.

A little more info here.

On the Atari's drive connector, pins 5 and 6 are the drive select,
but be aware that these are switched as you chain the drives through. I
usually connect the drive right to the drive A (Atari's) out port.

On the IBM Style drives, pins 10 & 12 are the drive selects. Use
drive select 0, (pin #10, in the Ibm style)

This should help you in making the drive work correctly. One more
note here. You will have to obtain (or write your own) program that will
tell the ST that you have a 5 1/4 drive connected and to slow the seek
rate down. The 5 1/4's cannot and will not work at the default seek rate.

Good luck!

OK, where did this come from, how can we get the reworked ADVSYS, and, most important -- are there docs on how to program it? The original ADVSYS is fascinating but ultimately frustrating because the docs don't give you enough information to actually program the durn thing!

You're correct, Farrell. The 40 folder limit still exists in the ROMs. We still recomment FOLDRXXX.PRG as the fix for the problem.

Which ST periodical was this? I thought we had most of them trained to call and verify information before printing things like that.

*** FLAME ON ***

What good does it do to start rumors like this?

Do us all a favor, if you need something to talk about, discuss the weather.

I'm not saying that it wouldn't be nice to add features to the machine. But, we're not adding this one at the moment. And there are so many rumors getting people jazzed up for nothing...

The rumor mill in our community has gone a bit haywire lately. There's enough going on without people making things up.

Most ridiculous rumors of 1987 awards:

1. The blitters didn't work, so we're using kludged-up Amiga blitters.

2. The blitters partially work, so we removed 4 of 8 functions from them.

Please, folks, give us a break. We're easy enough to talk to if you want to ASK a question. Sometimes it seems that rumors are so much fun that their veracity has no bearing on how they spread. Sometimes they spread AFTER the facts are clarified -- fiction being more fun, I presume.

*** FLAME OFF ***

Sorry folks, but it's been a rough year.

Best to all for 1988! Hope you're having a good holiday season.

Subject: Re: Multiuser BBS
To: info-atari16@score.stanford.edu

In article <1479@saturn.ucsc.edu>, koreth@ssyx.ucsc.edu (Steven Grimm) writes:

> The ST's BIOS is re-entrant. GEMDOS is not. (I have a multiuser BBS
> system to prove it...)

OK, Steven, where's my copy of the multiuser version? And whatever hardware it takes to make it work. Atari Base is waiting...

Maybe I'd better backtrack a moment. Here in Atari, we run a free BBS for users. It's known as Atari Base, and can be reached at 408-745-5308.

Here's the rub -- we run 5 lines into 5 separate systems. The line you get through to is simply the first available line. But, if you leave a question on that line, you'd better make darn sure you get back to that line.

We're looking for a solution. We need a way for the lines to talk to each other. Solutions that have been discussed, in order of preference, are:

1. Multi-port RS232 box that lets several modems talk to one ST. The advantage is that we'd need one computer instead of 5. The disadvantage is that if the one system goes down, everything dies. We're willing to live with this, because system crashes have been extremely rare in the 2 years since Atari Base opened in its current configuration.

2. Network that lets each line share messages. At one time there was talk of trying a MIDI-based network, but work on this was shelved by QMI due to the inability to resolve conflicting RS232 and MIDI interrupts. Maybe "PromiseLAN" will solve this one.

3. Using a system like Fnet or Fidonet and having lines call each other to pass messages. Not too elegant in my book, and lines are only updated at intervals (probably daily), but we could do this today if we wanted to.

The other burning issue is, which software to use? We're currently using the Michtron BBS. Michtron has abandoned its plan to sell a hardware multiport gizmo because the engineers in the UK who were working on one couldn't get it to work.

FoReM 2.0 supports Fnet, so if we wanted to go to approach #3 we could do it. But with the number of novice callers we get, I'm a bit leery of using FoReM. Any comments to the contrary, netlanders?

NiteLite Systems now has a hardware device to let 4 or 8 modems share an ST. Their BBS program supports this. But... well, I used NiteLite on the 8-bit before we went to the ST on our board. I like NiteLite's message facility, but the program needs improving in the user log (not sorted at all) and the download area. Paul Swanson, NiteLite's author, is working at making improvements, and is very willing to take criticism and act upon it.

BB/ST is very powerful, and Steven Grimm is working on the multi-line facility. But we're still waiting on some hardware. QMI is a great little company, but I know they're (almost) as overworked as we are at Atari. So, timetables for this are in doubt. Also, BB/ST's tree-structured message base is not my cup of tea.

And then there's BBS Express ST. Keith Ledbetter is doing a nice job on this one. The message base and file areas work well. But there's been no hint from ICD about the prospects for a multi-line function. I'd like to hear of one, because I like the program, which has a nice extra for us -- the script language for it would make development of an online order entry system fairly simple. It would be a boon to users to allow them to order spare parts online.

One last thing -- we're committed to running the whole thing on Atari equipment. Partly because of budget (total cost for system hardware out-of-pocket to date has been $0), and mainly because it's a good excuse to push the envelope of what can be done on the system. The makers of BBS programs would love to see us use their program, because it's a great promotion for them. So, I tell them to give me what I need! Maybe some day it will work.

Just to not irritate anyone, I'm aware of the PD program STadel, but this one gave new users fits when I tried it at home. And there's CBBS from Oasis, which just came in and hasn't been tried yet. No word on multi-line functions here either.

Any helpful advice from netland?

Just having obtained a SH205 with a 85cm cable (here in Holland it is prohibited
by law to use inches) I followed Landon's suggestion in a simplified way: just
2000 times 'cmp aap noot >> mies' with aap, noot identical 64K files. Cmp did
not report any errors on this 256M data transfer in spite of various lamps,
a monitor etc. being switched in the neighbourhood. And I rather like the
longer cable.

My questions to IDRIS users:
- An emulated MMU seems a good idea if there is no hardware. But doesn't that
make the OS very slow?
- Any experience with porting UNIX software?

Does anybody know whether IDRIS is available in Germany?

In my first letter I mentioned the OS's RTOS-UH and EUMEL. Several people
asked for more information about these. I don't feel too competent...
If there is somebody who knows them well and is ready to write an article
about them (or one of them), I'd be grateful. If not, I am willing to look
up the magazine articles and to extract a short characterization.

Subject: Hard drives for the ST
To: info-atari16@score.stanford.edu

I have noticed a few requests on the net for information regarding
hard drives, hard drive kits, and the like for the ST. I have just
purchased a "TAMI-HD40" hard drive system from FutureDOS, and am *very*
happy with it so far.

I own an Atari Mega-2 ST and required a larger disk capacity in order
to run GEM, Magic Sac, and OS-9/68000 efficiently. The single drive system I
received from FutureDOS is in a long enclosure that is designed to accommodate
a second half height drive.
Since the system is custom made, I ordered the 44 Mb (formatted) hard
disk configuration, for which I paid $1400 Cdn.. Other capacities are
available upon request. Also, all of the hard drive systems are fully
assembled and tested, so reliability is assured.

If you are looking for a high quality/high capacity hard drive system
at a reasonable price, then this may be the thing for you. You can
reach the folks at FutureDOS by writing them at

FutureDOS,
1207-120 Torresdale Ave.,
North York, Ontario,
CANADA, M2R 3N7.
Tel. (416) 736-0321

Christopher Parkinson
yunexus!gen1!yuplanet!chris

BTW-Standard disclaimer...I am in no way affiliated with FutureDOS, I am
just another happy customer!!!

Subject: EasyDraw XX.XX
To: info-atari16@score.stanford.edu

I saw a demonstration of EasyDraw recently, the version # of which
I don't know. I have a few peeves about the package which prevent me
from purchasing it. Since I do need an object oriented drawing package
I wanted to confirm that my objections are legitimate. If they are, and
if EasyDraw is listening then please take them as suggestions.

1. Text cannot be rotated. (FATAL if you want to draw rough
graphs). The closest you can get is something like:

R
o
t
a
t
e.

Not too useful if you are considering drawing architectural
plans which require sideways printing for a better fit.

2. Exiting will always request if you want to save your file even
if you have made no changes since the last save.

3. You have to explicitly select an object and then click again
to move it. A single click should suffice the way it does with
copying files etc.

4. The default for text should be justify off. I usually use
text as labels and can't see why justify should be on. I also
forgot most of the time to change justification when entering
text so that I had to go and change text attributes - a real
nuisance.

Some of the features I wish had been adopted from MacDraw:

5. A cubic spline fit (called SMOOTH and UNSMOOTH in MacDraw).
A really useful feature when one wants to draw gaussians and
sine waves etc. the way I needed to for my thesis.

6. The ability of picking a larger than one page size for the
drawing and then having EasyDraw print it out serially page
wise. This allows more complex drawings to be mosaiced easily.

Has anyone had similar experiences?

Subject: WordPerfect Update
To: info-atari16@score.stanford.edu

Just a note for WP users. The new update is supposed to be
out in early January. Since I didn't get any response to my
previous posting about the numerous bugs in WP I am not really sure
if any WP users actually exist. 8-{)

In response to Neil Harris' comment that the support is excellent, I have
a few comments of my own:

1. No company, software or otherwise, should be able to release
a product that doesn't even come close to working.
Bugs are one thing - fatal bugs another. I use the following
analogy - If I approached WP and asked them to give me
a copy of the software, and then told them that I would pay
them in a few months i.e. whenever I could afford it, I would
not expect them to hand over the package. And yet, WP has
taken money from users and then handed over a useless package
without ever notifying any of its users that there are problems.
And when a user tracks down the bugs and calls WP, they say
they are aware of it and a working version should be out soon.
Soon in my case has meant 3 months now, and I still don't have
a working version.

2. A company that only includes its UTAH address for technical
support, even in packages sold in Canada can hardly be seen
as being concerned for all of its users. By the way the (800) number
doesn't work from Canada so that you have to call WP on your
own expense during the day at full rate. Technical support
does exist in Canada from J.B. Marketing in Cornwall. Their
phone number is : 1-(800)-267-1731.

3. Part of servicing a product means keeping in touch with the
buyers and users and being above board about things(i.e.
through bulletins). I have not seen
any indication that WP considers this a priority. This is
critical in the present case where there must be bewildered
users trying to figure out why a $595 software package doesn't
work.

I think the larger issue here is the ethics with which high tech companies
